## Warranty Information

**EXCLUSIVE EXPRESS LIMITED WARRANTY:** Cummins Fire Power (CFP), division of Cummins NPower, LLC expressly warrants to the original end consumer only that, for a period not to exceed the earlier of two (2) years or 2000 hours of use from the start-up date (or, if the original end consumer fails to register as purchaser with CFP, six (6) months from CFP shipment date), the diesel fire pump drivers, manufactured and sold by CFP, shall be free from defects in material and workmanship when used and serviced in accordance with the Operations and Maintenance manual for the applicable Cummins Fire Pump engine model (the "Exclusive Warranty"). The Exclusive Warranty is nontransferable and shall immediately terminate and be of no further force or effect upon the sale, lease, assignment, transfer or other disposition by an original end consumer of a Cummins Fire Pump engine that contains a diesel fire pump driver covered by this Exclusive Warranty. Nothing contained herein shall be construed to extend the Exclusive Warranty, and the Exclusive Warranty shall not be extended, to:

- · Maintenance, adjustment, installation or start-up costs;
- Diesel fire pump driver failure due to normal wear, accident, misuse, abuse, neglect, improper installation or a defect attributable to a Cummins Fire Pump engine;
- · Alterations or modifications not authorized in writing by CFP;
- Additional components added to a diesel fire pump driver package subsequent to shipment of the engine; or
- · Starting batteries
- · Coolant heaters are covered for 12 months.

**DISCLAIMER OF WARRANTIES:** Except for the Exclusive Warranty provided above, which is in lieu of all other express and implied warranties, CFP EXPRESSLY DISCLAIMS ALL EXPRESS AND IMPLIED WAR-RANTIES, INCLUDING THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PAR-TICULAR PURPOSE.

**LIMITATION AND EXCLUSION OF REMEDIES:** All claims under this Exclusive Warranty shall be deemed waived by the original end consumer if not submitted to CFP or an authorized distributor within thirty (30) days of initial discovery that a diesel fire pump driver is not conforming to the Express Warranty. The original end consumer's remedy under this Exclusive Warranty is limited, in CFP's reasonable discretion, to repair, replacement or other appropriate adjustment of a nonconforming diesel fire pump driver determined, upon CFP's inspection, to have been properly installed, maintained and operated in accordance with the Operations and Maintenance manual furnished by CFP. IN ANY EVENT, CFP SHALL NOT BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES.

The Cummins Industrial Warranty covers the base engine for a period of time not to exceed the earlier of two (2) years or 2000 hours of operation from the date of delivery and start-up of the engine. Reference bulletin numbers 3381321 US/Canada & 3381322 Outside US/Canada. Cummins Fire Power components are warranted for a period of time not to exceed the earlier of two (2) years or 2000 hours of operation from the start-up date of the fire pump system, and the coverage includes travel time and mileage for the first year of the Limited Warranty, and repair or replacement of parts and reasonable cost of labor. The Cummins Fire Power Limited Warranty does not cover failures or damage due to abuse or neglect and including, but not limited to: shipping damage, improper storage, improper installation, unauthorized modification or lack of maintenance. Cummins Fire Power is not responsible for incidental or consequential damages.

### **Section 1 - Safety**

#### **1.1 Introduction**

Cummin's Fire Power and Engine Manuals should be considered part of the equipment. Keep the manuals with the equipment. If the equipment is traded or sold, give the manuals to the new owner.

All personnel responsible for operation and maintenance of the equipment should read and thoroughly understand this manual.

#### 1.2 Advisory and Cautionary Statements

Advisory and Cautionary Statements are used throughout this manual to call attention to special information, correct operating procedures and to safety precautions.

**NOTE:** A general advisory statement relating to equipment operation and maintenance procedures

**IMPORTANT:** A specific advisory statement intended to prevent damage to the equipment or associated components.

Cautionary Statements consist of two levels:

### WARNING

Indicates the presence of a hazard which CAN cause severe personal injury.

### 

Indicates the presence of a hazard which CAN cause personal injury, or cause equipment damage.

#### **1.3 Safety Precautions**

**Warning:** Read and understand all of the safety precautions and warnings before performing any repair. This manual contains the general safety precautions that must be followed to provide personal safety. When they apply, special safety precautions are included with operating procedures. **Warning:** Perform a walk around inspection and alert all area personnel that the equipment will be starting before manual operation.

**Warning:** Do not operate faulty or damaged equipment. Ensure that all hoses, pipe connections, clamps and guards are in place and securely fastened. Electrical components should be kept in good working condition and repaired immediately by qualified personnel.

**Warning:** After performing maintenance, remove all tools and foreign materials, reinstall and securely fasten ALL guards, covers and protective devices.

**Warning:** Exposed in-running belt nips can cause severe personal injury or dismemberment. Ensure that guards are in place and securely fastened before operation.

**Warning:** Rotating drive shafts can lacerate, dismember or cause strangulation. Keep hands, body parts, long hair, or loose-fitting clothing clear at all times.

**Warning:** Never attempt to manually clean a machine while it is operating or in standby mode.

**Warning:** Never open ports on tanks or piping while the engine is operating. Contact with pressurized agents can cause severe personal injury.

**Warning:** Relieve all pressure in the air, oil, and the cooling systems before any lines, fittings, or related items are removed or disconnected.

**Caution:** Engine fuel is flammable when in contact with electrical spark or flame sources. Remove all sources of spark or flame from the work area.

**Caution:** Always use the same fastener part number (or equivalent) when replacing fasteners.

**Caution:** Some state and federal agencies in the USA have determined that used engine oil can be carcinogenic and can cause reproductive toxicity. Dispose of waste oil in accordance with applicable requirements.

### **Section 2 - Description**

#### 2.1 Introduction

This manual contains information for the correct operation and maintenance of a Cummins Fire Pump Engine. Read and follow all safety instructions. Refer to the General Safety Instructions in Section 1 -Safety.

This manual covers installation, operation, and maintenance of models CFP5E and CFP7E. Most illustrations are representations that are common between both models. Where differences occur, refer to Section 8 - Component Parts and Assemblies for specific information.

Keep this manual with the equipment. If the equipment is traded or sold, give the manual to the new owner.

Cummins Fire Power, Cummins NPower and Cummins, Inc. reserve the right to make changes at any time without obligation. If any differences are found between an engine and the information in this manual, contact the local Cummins Authorized Repair Location. The latest technology and the highest quality components were used to produce this engine. When replacement parts are needed, we recommend using only genuine Cummins or ReCon® exchange parts.

#### 2.2 Fire Pump Engines

Cummins complete line of fire pump engines have been approved as packaged units (engine and all accessories) by Factory Mutual Approvals and listed by Underwriter's Laboratories, Inc. and Underwriter's Laboratories of Canada.

This product meets Tier 3 emission levels. This turbocharged engine requires charge air cooling (CAC).

No deviations are permitted without prior written approval. These engines are to be used only for fire protection applications. Refer to Figure 2-7, Figure 2-8, Figure 2-1 and Figure 2-2.

#### Figure 2-2 Engine Components - Turbocharger Side (CFP7E Shown)

#### 2.3 Operator Control Panel

The operator control panel is mounted on the right side of the engine at the flywheel end. Refer to Section 4 - Controls for additional information.

The operator control panel contains controls for starting, monitoring engine performance and controlling fire pump engine operation.

#### 2.3.1 Overspeed Switches

Each engine is equipped with an electronic overspeed module which activates the fuel pump solenoid valve and ECM ignition to shut off the engine when the RPM exceeds a preset limit. The overspeed switch senses engine speed during the start cycle and stops the starting motor cranking cycle. Refer to Figure 2-3.

#### 2.3.2 Operating Speed

All Cummins fire pump engines are shipped from the factory adjusted to the requested operating speed (RPM). Final operating speed adjustment must be made during the in-service inspection to obtain the required operating speed specified by the pump manufacturer.

- 2. Speed Increase/Decrease Toggle Switch
- 3. RESET Button
- 4. TEST Button
- 5. Diagnostic ON/OFF Toggle Switch
- 6. CRANK Termination or RUN Signal Indicator LED (Factory Use Only)
- 7. Overspeed Indicator LED
- 8. Pre-wired Terminals
- 9. Crank Terminate Potentiometer Cover
- 10. Overspeed Potentiometer Cover

#### Figure 2-3 Engine Overspeed Control Module

#### 2.4 Fire Pump Controller

Fire pump controller is not supplied by Cummins Fire Power, or Cummins, Inc. The fire pump controller starts the engine automatically when a remote fire demand signal is initiated and automatically shuts down the engine when the fire demand signal is discontinued.

The engine may be started locally in the Manual Mode and shut down using the operator control panel Stop Switch or by returning the switch back to automatic mode.

**NOTE:** Pressure recorders are available to provide a permanent record of water pressure fluctuations and engine starts. Sequential starting is available for multiple-pump installations to prevent all pumps from starting simultaneously.

#### 2.5 Air Intake System

The Air Intake System supplies combustion air to the fire pump engine cylinders. The air filter prevents particulate matter from entering the air intake. Combustion air drawn into the system by the turbocharger is directed through the charge air cooler (CAC) heat exchanger for cooling before entering the intake manifold where the charge air is mixed with fuel. Refer to Figure 2-4 and Figure 2-5.

- 1. Turbocharger
- 2. Exhaust Flex Connection
- 3. Exhaust Manifold
- 4. Turbo Connection to Charge Air Cooler
- 5. Air Cleaner Assembly (intake)

- 4. Charge Air Cooler (CAC) Heat Exchanger
- 5. Charge Air Cooler Outlet Hose/Pipe
- 6. Combustion Air Intake Manifold

#### Figure 2-5 Engine Air Intake and Charge Air Cooling Flow Diagram (CFP7E Shown)

#### 2.6 Raw Water Cooling System

The fire pump raw water supply provides cooling water for the engine heat exchanger system. A water-to-air Charge Air Cooler (CAC) Heat Exchanger,

reduces the combustion air temperature at the intake manifold. A low charge air temperature (requirement of 60° C (140° F) (with 25° C (77° F) ambient) meets emission levels, while improving engine performance and efficiency.

#### Figure 2-6 Engine Cooling System Flow Diagram

- 1. Coolant Fill Cap
- 2. Charge Air Cooler (CAC) Heat Exchanger
- 3. Raw Water Discharge Connection
- 4. Coolant Heat Exchanger/Expansion Tank

#### Figure 2-7 Heat Exchanger Tanks

Water entering the cooling system through the raw water inlet, first circulates through the charge air cooler heat exchanger, cooling the compressed air from the turbocharger outlet ducting. The cooled combustion air exits the CAC outlet duct to the engine air intake manifold. Refer to Figure 2-7, Figure 2-8 and Figure 2-5.

**NOTE:** The raw water supply must be immediately available when the engine is started.

The raw water from the CAC heat exchanger then passes through the Engine Coolant Heat Exchanger. The raw water exits the Coolant Heat Exchanger through a 1" NPT discharge connection.

**IMPORTANT:** If the piping will be supplied by the customer, provide raw water supply piping and components equivalent to components supplied by Cummins Fire Power and as shown in Assembly Diagram, Raw Water Piping. Refer to National Fire Protection Association NFPA20 Chapter 11 for US installation requirements. When choosing components for the raw water supply and bypass, ensure that the internal cross sectional area of the component is at least as large as the recommended pipe size.

- 1. Bypass Water Wye Strainer
- 2. Bypass Water Inlet Valve
- 3. 3/4" NPT Raw Water Inlet

- 11. Bypass Water Outlet Valve
- 12. Pressure Gauge Isolation Valve
- 13. Water Supply Pressure Gauge

#### Figure 2-8 Raw Water Manifold (optional)

When the raw water piping is installed, adjust both pressure regulator set points (optional raw water manifold) before operating the pump.

- 1. The upper line is the bypass line. The bypass line outlet valve should be closed.
- 2. The lower line with the solenoid valve is the normal inlet line. The pressure gauge isolation valve must be open. The normal water inlet line valve should be open.

**IMPORTANT:** Monitor the oil pressure and coolant temperature gauges frequently. Refer to Lubricating Oil System Specifications or Cooling System Specifications in the Engine Data Sheets for recommended operating pressures and temperatures. Shut off the engine if any pressure or temperature does not meet the specifications. Maximum engine coolant temperature should not exceed 107° C (225° F). The coolant expansion pressure/fill cap must meet the minimum pressure of 10 kPa (15 psi).

The engine coolant system contains a mixture of at least 50 percent antifreeze and 50 percent water. The coolant level should be maintained so it is visible in the coolant level sight gauge.

### **CAUTION**

Continuous operation with low coolant temperature (below 70° C (158° F)) or high coolant temperature (above 107° C (225° F)) can damage the engine. Verify raw water pressure and flow.

- 7. ECM Module A

Figure 2-9 Fuel System Components - High Pressure Common Rail (HPCR - CFP7E Shown)

#### 2.6.1 Fuel Supply and Drain Location

The fuel supply and return connections are located on the rear engine support below the operator's control panel. Refer to Figure 2-9.

#### 2.7 High Pressure Common Rail (HPCR) Fuel System

The fire pump engine is equipped with an electronic fuel system that delivers precise fuel quantities with precise injection timing at high injection pressures. The system consists of a high pressure pump (up to 1600 BAR) that supplies a common fuel rail and accumulator manifold feeding 6 high-pressure electronic controlled injectors to provide precise fuel metering and timing. The system is controlled by the Engine Control module CM850 for fueling and timing based on temperature, altitude, boost pressure, and throttle position. Refer to Figure 2-9.

With the High Pressure Common Rail (HPCR) fuel system, fuel priming is required for conditions such

1.

2.

3.

4.

5.

6.

as: initial start-up, running out of fuel and maintenance of fuel system components (i.e., filter change).

#### 2.8 Engine Oil System

The Engine Oil System lubricates moving internal engine parts (pistons, piston arms, valves, cam shafts, drive shafts and bearings). The oil pump circulates oil from the oil pan, through the oil filter and into engine areas where friction may develop. Refer to Section D of the Cummins Operation and Maintenance Manual QSB4.5 and QSB6.7 Engine for additional information.

Typically engine oil has been added during manufacture and testing procedures, however, shipping restrictions can affect whether the oil is maintained in the engine or drained for shipment.

Check the oil level at the dipstick. Add oil as necessary to bring the oil level to the H (high) mark on the dipstick. Refer to Figure 2-11.

- 1. Oil Fill Port
- 2. Oil Level Dipstick

#### Figure 2-11 Oil Level Dipstick and Oil Fill Port

- 1. Exhaust Valve Ports
- 2. Engine Exhaust Manifold
- 3. Combustion Air To Charge Air Cooler
- 4. Turbocharger Turbine

### Figure 2-12 Flow Diagram - Exhaust System (typical)

3

CFP-011

- 1. Wastegate Actuator Cylinder

- 3. Combustion Air To Charge Air Cooler
- 4. Wastegate OPEN

 $\cap$ 

5

5. Wastegate CLOSED

#### Figure 2-13 Turbocharger Exhaust Flow Diagram (typical)

#### 2.9 Exhaust System

The exhaust system removes engine exhaust from the cylinders after the combustion process.The exhaust discharges from the exhaust manifold, passes through (drives) the turbocharger, and exits through the exhaust flex-pipe. Refer to Figure 2-12, and Figure 2-13.

### **Section 3 - Installation**

#### 3.1 Receiving and Handling Information

Cummins Fire Power Pump Engines are pre-assembled and tested before shipment. Parts not shipped attached to the engine are sometimes shipped individually. The equipment was thoroughly inspected and prepared for shipping before it was turned over to the carrier.

- 1. Carefully remove the components from the shipping container. Remove crating, shipping tape, braces and tie-downs.
- 2. Inspect the equipment for damage that may have occurred in shipping.
- 3. Check each item carefully against the shipping manifest or bill of lading.

#### 3.1.1 Damage During Shipping

File a *Claim For Damages* with the carrier, if your equipment was received damaged or not received at all. Notify Cummins Fire Power, or Cummins Inc. as soon as possible to determine if a replacement item or repair is required.

#### 3.1.2 Claim Filing Procedure

The following information is required if a claim is filed:

- 1. A *Claim Statement* describing the damaged or lost merchandise and how the claim was determined.
- 2. A *Bill of Lading* or *Freight Bill* is required as proof of who transported the freight.
- 3. A noted *Freight Bill* or *Inspection Report Copy*, as evidence of loss or damage.
- 4. *Invoice Copy* or other documents establishing the cost to you of the freight lost or damaged, or an *Invoice for Repairs*.

#### 3.2 Site Preparation

This section provides instructions for the initial installation, adjustment, and testing of the Cummins Fire Pump Engine. Appropriate portions of this section should be used when returning the engine to operation after overhaul or major maintenance.

The site should be clean and relatively level. Clear the proposed equipment area of overhanging obstructions and obstacles protruding from the floor.

Raw water piping should be installed by trained technicians, familiar with local, state and federal codes and regulations, per the equipment layouts supplied by Cummins Fire Power, or Cummins Inc.

#### 3.2.1 Site Considerations

Refer to the general fire pump and engine layout drawings for installation dimensions supplied with this manual.

### CAUTION

Avoid installation in a dusty or dirty environment. Provide adequate physical protection from other physical damage as may be present in the specific location.

Refer to National Fire Protection Association NFPA 20, Chapter 11 for US installation and applicable local code requirements.

 Lay out a designated center line on the site floor. Find the center line of the engine drive shaft. Lay out a center line on the cross frame members.

**IMPORTANT:** Ensure that the lifting device or forklift is capable of handling the package weight and size requirements.

2. If the engine is lifted separately, use the lifting hooks (supplied with the engine) and a spreader bar to position the engine. Refer to Figure 3-1.

If the engine is assembled with the drive line, pump and mounting base, use the lifting points provided on the mounting base or lift the entire skid using an approved fork lift. Refer to the layout drawings supplied with this manual for lifting points.

2. Lifting Lug

Figure 3-1 Engine Lifting lugs (Engine Only)

### 

**Ensure that the lifting device is capable of safely lifting the weight of the engine or the combined weight of the assembled pump base, drive line and pump. Refer to the Bill of Lading for combined shipping weights.** 

- 3. Position the engine as required for the interface with the fire pump, water piping, fuel piping, exhaust and air system connections.
- Position the engine center line to align the engine drive shaft with the fire pump drive. Ensure that the engine and pump are correctly aligned.
  - Ensure engine position is centered on frame side to side within ± .03 inch, by measuring outside of frame side to engine support leg mounting pad. (Compare two front engine supports and two back engine supports).
  - b. Align engine center line to pump center line within ± .03 inch. Refer to Figure 3-2.
  - c. The pump center line to the engine crankshaft center line (in vertical plane) is to be .25 inch: +0, -.25 inch offset.
  - d. Drive shaft mounting flanges must be parallel.

- 1. Planes Must Be Parallel
- 2. Align Both Mounting Center lines to  $\pm .03$ "
- 3. Distance to Equal Half of Total Travel
- 4. .25": +0, -.25" Offset

#### Figure 3-2 Drive Coupling Alignment

- 5. Check that the fire pump is properly installed per the pump manufacturer's specifications.
- 6. Connect the exhaust piping to a safe location, away from building air intake sources (air conditioners, windows, fresh air intake pipes, etc.).

Figure 3-3 Drive Coupling Grease Fittings

- 7. Check that the alternator/coolant pump drive belt is properly installed.
- 8. Check that all hoses and tubes are properly installed and all clamps secure.
- 9. Lubricate grease fittings on the drive shaft universal joint. Refer to Figure 3-3.
  - a. Wipe the grease fittings and grease gun nozzle with a clean cloth.
  - b. Add grease to the universal joint grease fittings.
  - c. Wipe excess grease from the grease fittings.

**NOTE:** *Cummins Fire Power, or Cummins Inc. recommends using a good quality semi-synthetic, molybdenum-fortified NLGI #2 lithium complex grease which protects from -54° to 400° F such as Valvoline Durablend®.* 

**NOTE:** Some lubrication loss may occur during transport and storage. It is recommended that the drive shaft be re-lubricated upon installation.

#### 3.3 Fuel Supply Installation

1. Install an elevated no. 2 diesel fuel tank or other fuel supply arrangement which is compatible with ASTM no. 2 diesel fuel specifications.

- 1. Engine Pedestal Leg
- 2. 3/8" NPT Fuel Return Connection
- 3. 1/2" NPT Fuel Supply Connection

#### **Figure 3-4 Fuel Line Connections**

**NOTE:** The fuel supply line at the fuel tank must be higher than the fuel intake port on the engine fuel pre-filter/water separator. Ensure that the fuel system is installed in a safe and effective manner.

- 2. Size the fuel tank for the maximum expected fullload engine operation period with the initial fuel level at the minimum level for refueling.
- Install a 3/8" NPT (minimum) fuel return line. Route this line to the bottom of the fuel tank in order to minimize the return head. Refer to Figure 3-4.
- 4. Install a 1/2" NPT (minimum) fuel supply line to the fire pump engine.

**NOTE:** DO NOT use copper or galvanized pipe for the fuel return or supply lines.

#### 3.3.1 Fuel System Preparation

The fire pump engine fuel system has been primed during manufacturing and test procedures. The engine is equipped with an mechanical lift pump which primes the fuel pre-filter/water separator, primary fuel filter, and high pressure fuel pump when the engine is cranked. Refer to Figure 3-5.

A Water Separator must be integrated into the fuel delivery system of the fire pump engine. A Fuel Filter/ Water Separator may be installed directly on the unit in the primary fuel filter location, or a separate Fuel Pre-Filter/Water Separator may be installed near the fire pump engine assembly.

- Ensure that the filter/water separator is free of water by opening the fuel filter/water separator drain at the bottom of the separator. Refer to 6.3.5 Fuel System Inspections for additional information.
- 2. Drain the fuel into a container until no water is present. Dispose of the contaminated fuel in accordance with local environmental regulations.

### 

Due to the precise tolerances of diesel injection systems, it is extremely important that the fuel be kept clean and free of dirt or water. Dirt or water in the system can cause severe damage to both the fuel pump and the fuel injectors.

- 1. Primary Fuel Filter
- 2. High Pressure Fuel Pump
- 3. Fuel Pre-Filter/Water Separator

Figure 3-5 Engine Fuel System Components

#### 3.3.2 Fuel Recommendations

### WARNING

Do not mix gasoline, alcohol, gasohol, ethanol or methanol with diesel fuel. This mixture will cause severe engine damage or explosion.

### CAUTION

Use ONLY no. 2 diesel (ASTM no. 2D) fuel. Any adjustment to compensate for reduced performance with a fuel system using alternate fuel is not warrantable.

#### 3.4 Raw Water Supply Installation

Raw water circulated through the system cools the charge air cooler (CAC) heat exchanger and the engine coolant heat exchanger. Raw water supplied from the fire pump water source prior to the pump discharge flange, is forced through the cooling system to the various heat exchangers. Refer to Figure 3-6 and Figure 3-7.

**IMPORTANT:** The raw water supply must be immediately available when the engine is started. Ensure that the supply line valves are in the OPEN position.

### 

When the raw water piping is installed, adjust pressure regulator set points before operating the pump. Damage to the heat exchanger may occur from improperly regulated raw water supply pressure.

#### 3.4.1 Install Raw Water Piping

**NOTE:** The velocity of the raw water should be as great as possible without exceeding the maximum allowable pressure shown in the appropriate engine data sheet.

 Provide 1" NPT raw water discharge line at the outlet of the engine coolant heat exchanger. Refer to Figure 3-7.

- 1. Bypass Water Wye Strainer
  - Bypass Water Inlet Valve
- 3. 3/4" NPT Raw Water Inlet
- 4. Normal Water Inlet Valve
- 5. Normal Water Wye Strainer
- 6. Normal Water Pressure Regulator
- 7. Normal Water Solenoid Valve
- 8. Normal Water Outlet Valve
- 9. 3/4" NPT Outlet To Heat Exchanger
- 10. Bypass Water Pressure Regulator
- 11. Bypass Water Outlet Valve
- 12. Pressure Gauge Isolation Valve
- 13. Water Supply Pressure Gauge

#### Figure 3-6 Raw Water Manifold (optional)

2.

**NOTE:** Raw water outlet piping from the heat exchanger should be one pipe size larger than the supply piping.

- 2. Provide a raw water supply line to the engine assembly.
  - a. 3/4" NPT connection when using optional Raw Water Manifold
  - b. 1" NPT connection when using standard connection at Charge Air Cooler (CAC) Heat Exchanger

**NOTE:** The water supply set points have been set by the manufacturer during engine assembly and testing.

- 3. Check the pressure regulator setting with water flowing through the heat exchanger. If supplied as an option from CFP, both water pressure regulators have been set at 207 kPa (30 psig) or slightly less water pressure, during manufacture and testing. The raw water should be adjusted based on water flow rather than water pressure. The flow is dependent on the raw water temperature. Refer to the engine curve and data sheets for details.
- 4. Use a 5 gallon container to measure and time the flow from discharge pipe.

Flow rate = time to fill container/container size.

Example: Time to fill 5 gallon container = 15 seconds.

Divide 15 by 5 = 3 (seconds per gallon).

Divide 60 seconds by 3 = 20 gallons per minute.

5. Adjust both pressure regulators to a pressure that will provide a flow rate at or above the specifications.

The minimum raw water flow rate is provided on the Engine Data Sheets found in Section 8 -Component Parts and Assemblies.

**IMPORTANT:** The manual raw water valves for the Automatic Loop should remain OPEN at ALL times. The manual raw water valves for the Bypass Loop should be CLOSED during Automatic (pump controller) operation.

- 1. Coolant Heat Exchanger/ Expansion Tank
- 2. 1" NPT Raw Water Discharge
- 3. Charge Air Cooler (CAC) Heat Exchanger
- 4. 3/4" NPT Raw Water Inlet (optional manifold)
- 5. 1" NPT Raw Water Inlet (standard)

#### Figure 3-7 Cooling Loop Heat Exchangers

**NOTE:** When running, the engine should stabilize between 180° F and 185° F. The flow rate may need to be increased if the temperature stabilizes above this range. Do not exceed 60 psi.

**NOTE:** Excess cold (40° F to 75° F) raw water flow can cause condensation inside the charge air cooler.

**IMPORTANT:** Continuous operation with low coolant temperature (below 70° C (158° F)) or high coolant temperature (above 107° C (225° F)) can damage the engine.

#### 3.5 Battery Selection

The minimum recommended reserve capacity (SAE RC) and cold cranking ampere (SAE CCA) values for a particular engine can be found on the engine curve and data sheets. RC and CCA definitions can be found in SAE standard J537. All battery information is for lead/acid batteries.

Figure 3-8 Series Battery Connection - 24 VDC (optional)

#### 3.5.1 Battery Requirements

One set of batteries must be supplied for the standard 12VDC operating voltage. Two redundant sets of batteries must be supplied for the optional 24 VDC operating voltage. Refer to National Fire Protection Association, NFPA 20, Chapter 11 and Section 1 -Safety of this manual for additional battery installation information.

**IMPORTANT:** Batteries must meet the requirement listed in Electrical System Specifications. Batteries may be supplied by Cummins Fire Power, or Cummins Inc. as an option or may be supplied by the customer.

### 

Battery electrolyte (sulfuric acid) is highly caustic and can burn clothing, and skin. Wear impervious neoprene gloves, and safety goggles or full face shield, when working with the batteries. Always disconnect the negative battery cable first and reconnect it last.

### 

**Do not connect battery charging cables to any** electronic control system component. This can damage the electronic control system.

**NOTE:** Use the inductive charging-cranking systems analyzer, Cummins Part Number 3377193, to test the output amperage of either maintenance-free or con-

ventional vent cap batteries. Follow the instructions provided with the test equipment.

#### 3.5.2 Battery Installation

Install the Loose Wire Kit per instructions on Cummins Drawing 9767. If purchased, install the optional Battery Cable Kit (Cummins Fire Power Part No. 9614). Otherwise, install equivalent customer supplied wiring. Install battery sets in a well ventilated or otherwise protected location.

**NOTE:** There are two possible heavy-duty battery connections: Battery terminal and clamp or threaded battery terminal and nut.

- 1. Provide adequate room for servicing or replacing the batteries. Provide protection from extremes of temperature and weather.
- Locate the batteries near the engine or increase the size of the conductors as required by applicable codes. Ensure that the batteries are configured properly for standard 12 VDC operations or optional 24 VDC operations. Refer to Figure 3-8.
- 3. Check the battery cables and connections.

**NOTE:** Coat the terminals with petroleum jelly to prevent corrosion. Install the cables and tighten the battery connections.

#### 3.5.3 Auxiliary Battery Starting

If a battery charging system is not provided, the engine can be started using charged batteries.

**NOTE:** For maintainable lead acid batteries supplied by Cummins Fire Power, or Cummins Inc., check the state of charge by measuring battery cell specific gravity. Refer to Battery Testing in Section 6 - Maintenance for additional information.

### WARNING

Batteries can emit explosive gases during charging. Always ventilate the compartment before servicing the batteries. Remove sources of spark or open flame. To avoid arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

#### 3.6 Signal and Control Installation

This section explains how to connect the controller wires to the terminal block.

### 

*If the batteries have been installed prior to the control wiring, disconnect the negative cable first and then disconnect the positive battery lead.* 

### Install the cables with the positive cable first and the negative cable last before testing.

**NOTE:** Install signal and control wiring at Terminal Board TB. Refer to the terminal wiring schematic decal on the inside of the instrument enclosure.

1. Ensure that the fire control system is properly installed and configured per the manufacturer's instructions. Refer to the Wiring Schematic Drawings provided with the pump manual.

CFP-044

#### Figure 3-9 Termination Blocks and Wiring Decal

- Complete the fire pump controller wiring (customer supplied) per the manufacturer's instructions.
- 3. Connect the following wires to the Fire Pump Engine Instrument Panel per the engine electrical diagrams. Refer to Figure 3-9.
  - a. TB-1: Connect the Control Power from the Fire Pump Controller. This power source is necessary for fire pump operations while in the AUTO Mode.
  - b. TB-2: Connect the Crank Terminate Input signal for the Fire Pump Controller. This signal is present when the engine is running. This signal indicates that the engine has started and that the crank command from the fire pump controller should stop immediately.
  - c. TB-3: Connect the remote Overspeed Alarm Input to the Fire Pump Controller. This signal is present when the overspeed switch has operated. If this event occurs, the fire pump engine will stop.
  - d. TB-4: Connect the Low Oil Pressure Alarm Input from the Fire Pump Controller. This 0 VDC grounded signal is present when the oil pressure has dropped below the 110 ± 13 kPa (16 ± 2 psig) Set Point.
  - e. TB-5: Connect the High Coolant Temperature Alarm Input from the Fire Pump Controller. This 0 VDC grounded signal is activated when the engine is running and the coolant temperature is at or above 93° C (200° F). The alarm will deactivate when the engine is running and the coolant temperature drops below 88° C (190° F).
  - f. TB-6: Connect Battery Set "A" lead from the controller. The controller senses Battery A charge state and charges the battery through this heavy gauge wire.
  - g. TB-8: Connect Battery Set "B" lead from the controller. The controller senses Battery B charge state and charges the battery through this heavy gauge wire.
  - h. TB-9: Connect Crank From Battery A Lead. During a cranking cycle, the controller ener-

gizes the coil of Starter Contactor A through terminal TB-9 to start the engine.

- i. TB-10: Connect Crank From Battery B Lead. During a cranking cycle, the controller energizes the coil of Starter Contactor B through terminal TB-10 to start the engine.
- j. TB-11: Connect the "Battery Ground" lead from the controller. This heavy gauge wire provides a common ground between the engine and controller.
- k. TB-301: Connect the "Operating On Alternate ECM" lead. This 0 VDC ground signal is present when the engine's ECM selector switch is set to ECM-B.
- I. TB-302: Connect the "ECM / Fuel Fault" signal wire. This 0 VDC ground signal is present when the engine signals a trouble fault.
- 4. Ensure electrical continuity and adequate insulation resistance for the installed wiring.
- 5. Provide the initial charge on the redundant batteries per the battery charger's instructions.
- 6. 6. Check that both voltmeters on the local control panel indicate the approximate battery voltage.

#### 3.7 Coolant System Preparation

The fire pump engine coolant and lubrication system was initially filled during manufacture and testing.

### 

**Ensure that all coolant and lubrication systems** have been filled to the proper level before operation.

- Inspect the engine coolant hoses and hose clamps. Ensure that all coolant hoses and clamps are properly installed and water tight. Refer to Figure 3-10.
- 2. Ensure that the engine coolant level is visible at the center of the expansion tank sight gauge. Add coolant as required. DO NOT OVERFIL!

a. If engine coolant temperature is below 50° C (122° F), remove the expansion tank pressure cap and add coolant if necessary. Refer to Figure 3-11.

**NOTE:** Supplemental engine coolant should be a mixture of 50% ethylene glycol antifreeze and 50% water to avoid engine damage. Refer to Antifreeze information found in Section 6 - Maintenance for additional information.

- b. Install the pressure/fill cap on the coolant expansion tank.
- c. Check and correct any cooling system leaks.
- The engine coolant heater must maintain an engine coolant temperature of 49° C (120° F) or above.

Ensure that water is present in the engine heater before plugging in the heater element.

- 1. Hose Clamps
- 2. Upper Coolant Hose
- 3. Thermostat Housing
- 4. Lower Coolant Hose

#### Figure 3-10 Coolant Hoses and Clamps

- 1. Coolant Heat Exchanger/Expansion Tank
- 2. Coolant Pressure/Fill Cap
- 3. Coolant Level Sight Gauge

### Figure 3-11 Coolant Heat Exchanger/ Expansion Tank

#### 3.8 Charge Air Cooler System

The charge air cooler system reduces the temperature of the compressed combustion air from the turbocharger before entering the air intake manifold. Refer to Figure 3-12 and Figure 3-13.

- 1. CAC Tubing and Clamps
- 2. Intake Manifold
- 3. Charge Air Cooler Heat Exchanger

#### Figure 3-12 Charge Air Cooler Tubing

- 1. Turbocharger
- 2. Exhaust Flex Connection
- 3. Exhaust Manifold
- 4. CAC Piping

#### Figure 3-13 Turbocharger and CAC Piping

- 1. Inspect the charge air cooler piping and hoses for loose/missing hose clamps, hose punctures, leaking manifold seals, or corrosion. Torque the hose clamps to 8 N-m (72 in-lb).
- 2. After the engine starts, a whistling noise may indicate an air leak from the turbocharger to discharge elbow connection, loose hose clamps, damaged manifold seals, missing hose clamps, or hose punctures.
- Inspect for damage. Tighten loosen clamps. Torque hose clamp screws to 8 N-m (72 in-lb).

#### 3.9 Engine Oil System Preparation

The fire pump engine was initially lubricated during manufacture and testing.

### 

Some regulatory and shipping restrictions may require that all lubricants, fuels and coolants be drained for transport. Ensure that all cooling and lubrication systems have been filled to the proper level before operation.

- 1. Check the oil level using the crankcase dip stick before operating. Refer to Figure 3-14.
- 2. Fill the crankcase at the oil fill port, to the "H" mark on the dipstick with engine oil. Refer to Figure 3-14.

- 1. Engine Oil Fill Port
- 2. Engine Oil Level Dipstick

#### Figure 3-14 Oil Level Dipstick and Fill Port

**NOTE:** Do not use special "break-in" oils for new or rebuilt Cummins engines. Use the same type of oil during the "break-in" as used in normal operation.

**NOTE:** Using multi-viscosity engine oil can improve oil consumption control and improve engine cranking in cold temperatures while maintaining lubrication at high operating temperatures. Cummins Inc. recommends Valvoline Premium Blue® 15W-40 oil for most climates.

- 3. The turbocharger has been lubricated during manufacture and testing.
  - a. Remove the air filter element.
  - Botate the compressor wheel to allow oil to enter the bearing housing. Any excess oil will drain through the oil drain line. Refer to Figure 3-15 and Figure 3-16.
  - c. Lubricate the bearings by pouring 59 to 89 ml (2 to 3 oz.) of clean engine lubricating oil into the turbocharger oil supply line fitting.
  - d. Reconnect the turbocharger oil inlet line.
  - e. Install the air intake filter assembly.

- 1. Turbocharger Air Intake
- 2. Turbocharger Oil Line
- 3. Exhaust Flex Connection
- 4. Exhaust Manifold

#### Figure 3-15 Turbocharger Oil Line Location

- 1. Turbocharger Compressor Wheel
- 2. Turbocharger Intake Housing
- 3. Air Intake Tube and Clamp

#### Figure 3-16 Turbocharger Turbine Wheel (typical)

#### 3.10 Pre-Start Inspections

Perform a visual inspection as follows:

- 1. Check that there is no apparent damage and that all components are installed.
- 2. Check that the drive belt is properly installed.
- 3. Check that all hoses and tubes are properly installed.
- 4. Check that all electrical connections are properly installed.
- 5. Check that the fire pump is properly installed per the pump manufacturer's instructions, is correctly aligned, and is free to rotate.
- 6. Lubricate grease fittings on the auxiliary drive shaft.

**NOTE:** Some lubrication loss may occur during transport and storage. It is recommended that all drive shafts be re-lubricated upon installation.

7. Ensure that the engine exhaust pipe exhausts to atmosphere away from other building air intake piping.

#### 3.11 Engine Start Test

Perform the following engine start test after completing all preliminary setup procedures, previously covered. Additional engine start tests and speed adjustment procedures are explained in Section 5 -Operation.

### WARNING

Before operating the equipment, complete all safety checks, remove all tools and foreign objects from the equipment, ensure that all guards are in place and securely fastened. Alert area personnel that the equipment will be starting. Unintentional equipment start-up or contact with exposed or moving components can cause personal injury or equipment damage.

The object of this test is to check that the engine starts and operates normally with oil pressure being displayed and raw water flow being established to the coolant heat exchanger. Operation at the factoryadjusted rated speed is also checked.

- 1. Water Temperature Gauge
- 2. Engine Oil Pressure Gauge
- 3. Tachometer and Hour Meter
- 4. Circuit Breaker
- 5. Battery "A" Voltmeter
- 6. Battery "B" Voltmeter

#### Figure 3-17 Operator's Control Panel

- 1. To start the engine from the Fire Pump Controller Panel:
  - a. The AUTO Mode Switch position is the default operating position.
  - Place the AUTO/MANUAL Mode Switch on the operator's Instrument Panel in the AUTO Mode position. Refer to Figure 3-17 and Figure 3-18.
  - c. Start the engine by initiating an engine start signal from the Fire Pump Controller Panel.

**NOTE:** The fire pump engine will crank automatically when either solenoid A or solenoid B is selected at the fire pump control panel.

- 2. To start the engine from the Operator's Control Panel:
  - a. Disengage the AUTO/MANUAL Mode Switch Locking Button and place the switch in the MANUAL Mode position.

- 1. ON/OFF Switch Locking Button
- 2. AUTO/MANUAL Mode Switch
- 3. Overspeed RESET/STOP Switch
- 4. Low Oil Pressure Warning Lamp
- 5. Crank Battery A/B Momentary Start Switch
- 6. ECM Engine Shut Down Lamp (red)
- 7. ECM A/B Indicator Lamps
- 8. ECM Warning Lamp (amber)
- 9. High Water Temperature Warning Lamp
- 10. Overspeed Warning Lamp

#### Figure 3-18 Operator's Controls

- 1. Battery B Starter Contactor
- 2. Battery A Starter Contactor

#### Figure 3-19 Manual Starter Contactors

- b. Place the AUTO/MANUAL Mode Switch on the operator's Instrument Panel in the MANUAL position.
- c. Press downward on either CRANK BATT A/B Rocker Switch to start the engine.
- 3. To start the engine using the Manual Override Contactor A/B Levers:
  - a. Place the AUTO/MANUAL Mode Switch on the operator's Instrument Panel in the MAN-UAL position.
  - b. Press downward on either Manual Override Contactor A/B Lever to start the engine. Refer to Figure 3-19.
  - c. Release the Contactor Lever immediately after the engine starts.
- 4. Check that the engine starts and operates at rated speed.
- 5. The engine may be stopped locally by pressing and holding the Overspeed RESET/STOP Switch until the engine stops.

#### 3.11.1 Engine Will Not Start

If the engine still will not start, refer to Section 7 -Troubleshooting for possible causes.

#### 3.11.2 Engine Starts

When the engine starts it is important to monitor the oil and cooling water pressure gauges to ensure safe operation.

*If the oil pressure is not displayed on the gauge or if the Low Oil Pressure Lamp is illuminated for 15 seconds, STOP THE ENGINE immediately! Continued operation without proper lubrication will cause engine damage.* 

 Immediately check that oil pressure is displayed at the pressure gauge within a few seconds. Ensure that the oil pressure is between 276-414 kPa (40-60 psi).

If oil pressure is not within the rated range, troubleshoot per Engine Oil Pressure High or Engine Oil Pressure Low in Section 7 - Troubleshooting.

- 2. Immediately check that raw water flow is established through the coolant heat exchanger. Raw water flow should be established immediately but some delay may occur before the flow exits the heat exchanger drain connection.
  - a. Ensure that raw water is flowing through the heat exchanger and water pressure shown on the local pressure gauge is no more than 414 kPa (60 psig). The minimum raw water flow rate is provided on the Engine Data Sheets found in Section 8 - Component Parts and Assemblies.

### 

If the water temperature gauge is not reading properly or if the Water Temperature Lamp is illuminated for 15 seconds, STOP THE ENGINE immediately! Continued operation without proper cooling water will cause engine damage.

- 3. Ensure that engine operating temperature stabilizes between 82° and 95° C (180° and 203° F).
  - a. If temperature does not stabilize, stop the engine and refer to Coolant Temperature Above Normal or Coolant Temperature Below Normal (Engine Running) in Section 7
     - Troubleshooting.
- 4. Operate the engine for 8 to 10 minutes.
- 5. Inspect for leaks, unusual noises, or other indications of incorrect operation.
- 6. Shut off the engine by pressing and holding the Overspeed RESET/STOP Switch.
- 7. Check that raw water flow stops automatically shortly after the engine stops.
- 8. Correct any problems found during the inspection before proceeding.
- 9. Check the engine lubricating oil level at the crankcase dip stick. Top off if necessary.
- 10. Check the coolant expansion tank level. Top off if necessary.
- 11. Check the raw water wye strainers. Clean the strainers as required per the instructions in Section 6 Maintenance.
- 12. Perform engine speed control and safety system tests per the instructions in Section 5 Operation.

### **Section 4 - Controls**

#### 4.1 Operator Control Panel

The operator control panel is mounted on the flywheel end of the engine.

The instrument panel contains controls for starting, monitoring engine performance and controlling fire pump engine operation. Refer to Figure 4-1.

#### 4.1.1 Coolant Temperature Gauge

The Coolant Temperature Gauge displays the temperature of the coolant circulating through the fire pump engine. The gauge works in unison with the High Water Temperature Alarm Sensor to the fire pump controller at terminal TB-5. This 0 VDC grounded signal is present when the engine is running and the coolant temperature has risen above the 93° C (200° F) Set Point.

When the engine starts, immediately check that raw water flow is established through the heat exchangers. Raw water flow should be established immediately but some delay may occur before the flow exits the coolant heat exchanger drain connection. Stop the engine if the water temperature alarm is illuminated for more than 15 second.

### 

If the coolant temperature exceeds the high coolant temperature set point, the High Coolant Temperature Warning Lamp is illuminated. The engine will continue to operate but immediate attention is necessary in order to prevent extensive damage to the engine or catastrophic engine failure.

#### 4.1.2 Engine Oil Pressure Gauge

The Engine Oil Pressure Gauge displays the engine oil pressure. The gauge works in unison with the Low Oil Pressure Alarm Input from sensor TB-5. The 0 VDC grounded signal is terminated when the oil pressure has dropped below the 110 kPa (16 psig) set point.

When the engine starts, immediately check that oil pressure is displayed. It should be on-scale within a

few seconds. If oil pressure is not present or if the Low Oil Pressure Lamp does not go out, stop the engine and troubleshoot per the instructions in Section 7 - Troubleshooting.

- 1. Coolant Temperature Gauge
- 2. Engine Oil Pressure Gauge
- 3. Tachometer and Hour Meter
- 4. Circuit Breaker
- 5. Battery "A" Voltmeter
- 6. Battery "B" Voltmeter

#### Figure 4-1 Instrument Panel

Warning Lamp is illuminated. The engine will continue to operate but immediate attention is necessary in order to prevent extensive damage to the engine or catastrophic engine failure.

#### 4.1.3 Tachometer and Hour Meter

The Tachometer displays the engine speed in revolutions per minute (RPM) whenever the engine is operating. The Hour Meter maintains a running total of the hours of operation (run time). The Tachometer works in unison with the Engine Overspeed Alarm Input from sensor TB-3. This 12 VDC signal is present when the overspeed switch has operated.

## 

If this event occurs, the fire pump engine will stop to avoid fire system over-pressurization. The fault must be corrected and the local RESET Button must be pressed in order to restart the engine.

**NOTE:** The Run Speed and Engine Overspeed Set Point are displayed on the Factory Setting Tag, on the side of the operator instrument panel.

**NOTE:** Electronically controlled engines should operate within a few RPM of the rated speed whether the engine is fully loaded or unloaded. If it becomes necessary to adjust the engine's actual speed to match the rated value, refer to Rated Speed Set Point Adjustment in Section 5 - Operation.

## 4.1.4 Battery A and B Voltmeters

The Battery Voltmeters display the charge status (VDC) of the relative battery connections. Permanently installed redundant battery charging systems with connections at TB-6 and TB-8 (+) and TB-11 (-) should also be used for remote battery voltage indications at the fire pump control system or elsewhere.

**NOTE:** The two voltmeters may differ slightly due to calibration differences between the meters. Normal differences in battery condition may also cause indication differences. These are normal differences and require no action.

## 4.1.5 Circuit Breaker Switches

The engine control panel has two manual-reset type, 30 A Circuit Breakers. They protect against a catastrophic failure, such as a direct battery-terminal ground fault or a battery charger malfunction. One breaker is for Battery A, and the other breaker is for Battery B.

**NOTE:** If one of the circuit breakers trips, locate and repair the source of the fault before pressing the RESET Button.

## 4.1.6 AUTO/MANUAL Mode Switch

The AUTO/MANUAL Mode Switch determines whether the engine starts and is controlled by the

operator (MANUAL) or by an automatic signal from the fire pump controller (AUTO). Refer to Figure 4-2.

The Manual Mode is typically used for engine setup, testing and maintenance procedures. The AUTO Mode is used to start the engine under the control of the fire pump control system (in the absence of a live operator).

In the AUTO mode, the fire pump engine stops upon loss of signal power from the fire pump controller.

CFP-022

- 1. ON/OFF Switch Locking Button
- 2. AUTO/MANUAL Mode Switch
- 3. Overspeed RESET/STOP Switch
- 4. Low Oil Pressure Warning Lamp
- 5. Crank Battery A/B Momentary Start Switch
- 6. ECM Engine Shut Down Lamp (red)
- 7. ECM A/B Indicator Lamps
- 8. ECM Warning Lamp (amber)
- 9. High Coolant Temperature Warning Lamp
- 10. Overspeed Warning Lamp

## Figure 4-2 Operator Panel Controls

#### 4.1.7 Overspeed Warning Lamp

The Overspeed Warning Lamp is illuminated whenever the engine RPM rate exceeds the factory set Engine Overspeed Set Points. The lamp is not lit when the engine is operating within the normal engine RPM range. Refer to Figure 4-2.

**NOTE:** The Run Speed and Engine Overspeed Set Point are displayed on the Factory Setting Tag, on the side of the operator instrument panel. Refer to Figure 4-3.

## 4.1.8 Engine Overspeed Warning Lamp

The Overspeed Sensor monitors engine speed during the start cycle and engine operation. The remote Overspeed Alarm Input from the engine controller is connected to terminal TB-3. The speed switch is factory programmed to enable at 115% rated engine speed. If the engine RPM's exceed 115% rated speed, the engine Overspeed Warning Lamp is illuminated and the engine will shut down.

**NOTE:** The overspeed switch has been set at the factory during assembly and testing. It should not require additional programming unless the pump operating speed is changed.

## 

If the Overspeed Sensor is tripped, the fire pump engine will stop to avoid catastrophic failure. The fault must be corrected and the local RESET Button must be pressed in order to restart the engine.

## 4.1.9 Overspeed RESET/STOP Switch

Pressing the Overspeed RESET Switch after correcting an engine overspeed shutdown, resets the operator controls, allowing subsequent restart of the fire pump engine.

- 1. Field Engine Speed and Overspeed Settings
- 2. Factory Engine Speed and Overspeed Settings
- 3. Engine Serial Number Plate

## Figure 4-3 Engine Settings Plates

## 4.1.10 High Coolant Temperature Warning Lamp

The High Coolant Temperature Lamp is lit whenever the engine is running and the coolant temperature has risen above the  $93^{\circ}$  C (200° F) Set Point.

**IMPORTANT:** If high coolant temperature lamp does not go out, stop the engine and troubleshoot per the instructions in Section 7 - Troubleshooting.

## 

If the coolant temperature exceeds the high coolant temperature set point, the high coolant temperature warning lamp is illuminated. The engine will continue to operate but immediate attention is necessary in order to prevent extensive damage to the engine or catastrophic engine failure.

## 4.1.11 Low Oil Pressure Warning Lamp

The Low Oil Pressure Warning Lamp is switch activated at a falling pressure of 110 kPa (16 psig), and deactivates at a rising pressure of 83 kPa (12 psig) Set Point. (When the engine is not running, the Low Oil Pressure Lamp will be illuminated). When a Low Oil Pressure condition exists, the Low Oil Pressure Lamp on the Engine Control Panel will illuminate.

**IMPORTANT:** If oil pressure is not present or if the Low Oil Pressure Lamp does not go out, stop the engine and troubleshoot per the instructions in Section 7 - Troubleshooting.

## 

If the engine oil pressure drops below the minimum oil pressure set point, the low oil pressure warning Lamp is illuminated. The engine will continue to operate but immediate attention is necessary in order to prevent extensive damage to the engine or catastrophic engine failure.

## 4.1.12 CRANK BATT A/B Switch

The fire pump engine requires (2) 12 VDC lead/acid core batteries for standard 12V operation. If using the optional 24VDC operation, (2) sets of (2) 12VDC lead/acid core batteries are required with each pair wired in series to produce 24 VDC. The batteries can be supplied by Cummins Inc. or by the customer.

The CRANK BATT A and CRANK BATT B Momentary Start Switches initiate an immediate engine start using the selected A or B Crank Battery.

## 4.1.13 ECM Fault Code Lamps

The AMBER Engine Warning Lamp and the RED Engine Shutdown Lamp serve three purposes:

1. To alert the operator of an engine malfunction. Refer to Figure 4-2.

An illuminated AMBER Lamp indicates an engine malfunction that requires timely operator attention.

- 2. An illuminated RED Lamp indicates an engine malfunction that requires immediate and decisive operator response.
- To flash out a 3-digit diagnostic fault code, which can then be used to help describe the nature of the engine malfunction. Refer to Section 5 -Operation for Fault Code Information.

#### 4.1.14 ECM A/B Indicator Lamps

The two ECM Indicator Lamps show the position of the ECM Switch. If the ECM Switch is in the ECM A (normal) position, ECM A is controlling the engine, and the ECM A lamp is illuminated. Refer to Figure 4-2 and Figure 4-4.

- 1. ECM A/B Selector Switch
- 2. ECM Selector Panel
- 3. ECM Harness Connections

Figure 4-4 ECM Selector Panel and Switch

If the ECM Switch is in the ECM B (alternate) position, ECM B is controlling the engine, and the ECM B lamp is illuminated. Terminal 301 will be active (ground) for remote annunciation.

## 4.2 Electronic Control Module

The system has an electronically controlled fuel injection system that optimizes fuel economy and reduces exhaust emissions. It does this by controlling the torque and horsepower curve, AFC function, engine high speed, low idle, and load speed. Refer to Figure 4-5.

The engine control system is an electronically operated fuel control system that also provides many operator or equipment features. The base functions of the control system include: Fueling and timing control, limiting the engine speed operating range between the low and high-idle set points and reducing exhaust emissions while optimizing engine performance.

The control system uses inputs from the operator and engine sensors to determine the fuel amount and timing required to operate at the desired engine speed. The ECM is the control center of the system. It processes all of the inputs and sends commands to the fuel system, vehicle, and engine control devices.

The ECM performs diagnostic tests on most of its circuits and will activate a fault code if a problem is detected in one of these circuits.

Active fault codes will cause a diagnostic lamp to activate to signal the driver. The ECM can communicate with the Insite<sup>™</sup> service tool and some other engine controllers.

## 4.2.1 ECM Data Plate

The ECM Data Plate shows information about the ECM and how the ECM was programmed. The data plate is located on the front of the ECM. Refer to Figure 4-5.

The following information is available on the ECM Data Plate: ECM Part Number (PN), ECM Serial Number (SN), ECM Date Code (DC), Engine Serial Number (ESN), ECM Code: Identifies the software in the ECM.

**NOTE:** Have the ECM code for your engine available when communicating with a Cummins Authorized Repair Location.

- 1. ECM Data Plate
- 2. Electronic Control Module (ECM) B
- 3. ECM Harness Connections
- 4. Electronic Control Module (ECM) A

## Figure 4-5 Electronic Control module (ECM)

## 4.3 Overspeed Switch

The overspeed switch senses engine speed during normal operation and during the start cycle. The switch deactivates the fuel pump solenoid valve and shuts off the engine whenever the speed exceeds the overspeed set point. Refer to Figure 4-6.

**NOTE:** The overspeed switch is set during manufacture and test procedures and typically does not require setup at installation.

- 1. Use the Adjustment and Test Procedure in Section 6 Maintenance to change the set point.
- 2. Repeat the adjustments and checks until the desired set point is demonstrated. When the overspeed set point is set, check that the engine operates normally while not in the Test Mode.

**NOTE:** The overspeed set point must be set at between 115 and 120% of the engine's rated speed.

The speed switch located on the engine's local control panel has a TEST button which lowers the currently adjusted overspeed by 20%.

Thus, an overspeed set point of 2112 rpm would be reduced to (2112 \* 0.8) = 1689 RPM when the test button is pressed.

- 1. Spring Clamp Terminal Blocks
- 2. Speed Increase/Decrease Toggle Switch
- 3. RESET Button
- 4. TEST Button
- 5. Diagnostic ON/OFF Toggle Switch
- 6. CRANK Termination or RUN Signal Indicator LED (Factory Use Only)
- 7. Overspeed Indicator LED
- 8. Pre-wired Terminals
- 9. Crank Terminate Potentiometer Cover
- 10. Overspeed Potentiometer Cover

## Figure 4-6 Engine Overspeed Control Module

## 4.4 Raw Water Flow Control Valves

The engine controller should be set to open the raw water Normal Loop Solenoid Valve in either Manual or Automatic Mode. In the OPEN position, water can flow through the heat exchangers. Refer to Figure 4-7.

The manual raw water valves control whether the Automatic or Bypass lines are supplying water.

- 1. Manual raw water valves for the Automatic Loop should remain OPEN at ALL times.
- 2. Manual raw water valves for the Bypass Loop should be CLOSED during Automatic (pump controller) operation.

- 1. Bypass Water Inlet Valve
- 2. Normal Water Inlet Valve
- 3. Normal Water Solenoid Valve
- 4. Normal Water Outlet Valve
- 5. Bypass Water Outlet Valve

#### Figure 4-7 Raw Water Flow Control Valves

## 4.5 Engine Protection System

The engine ECM monitors any engine abnormalities, and displays active faults via the AMBER Warning Lamp and the RED Shutdown Lamp on the operator instrument panel. Refer to Section 7 - Troubleshooting for additional Fault Code information.

## 

Normally, Cummins engines with ECMs have derate and shutdown protection calibrated into the ECM. However, the ECM on this Cummins engine has no such derate or shutdown protection. The engine will run to destruction. Therefore, preventive maintenance is essential.

## 4.5.1 Engine Protection Fault

When an Engine Protection Fault (EPF) occurs, a corresponding Warning Lamp is illuminated on the operator's instrument panel. If an overspeed situation exists, the EPF automatically shuts down the fuel supply solenoid valve.

The EPF System uses a combination of any of the following engine controller sensor inputs:

- 1. Low Coolant Temperature (lamp warning).
- 2. High Coolant Temperature (lamp warning).
- 3. Low Coolant Level (lamp warning).
- 4. Low Oil Pressure (lamp warning)
- 5. Low Oil Level (lamp warning)

# **Section 5 - Operation**

## 5.1 Start-up Procedures

This section provides the operator with the information required to prepare the fire pump engine for normal operation, in a safe manner. This Operator's Manual is provided for your specific equipment and should be considered a part of that equipment. All personnel responsible for the operation and maintenance of the equipment should read and thoroughly understand this manual.

## 

Before preparing the machine for normal production, complete all safety checks, remove all tools and foreign objects from the machine, ensure that all guards are in place and securely fastened, and alert area personnel that the equipment will be starting.

## 5.2 General Operating Information

Cummins Fire Pump Engines are tested before being shipped from the factory. The engine operating speed must be set per the pump RPM requirements.

**NOTE:** The engine speed set points are displayed on the Factory and Field Setting Plates, located on the flywheel end of the engine.

## 5.3 Remote Starting Procedure

If the AUTO/MANUAL Mode Switch is in the AUTO Mode position, the pump engine starts automatically upon receipt of the start command from the customer installed pump control panel. The AUTO Mode is the default switch position.

**NOTE:** The AUTO/MANUAL Mode Switch Locking Button must be disengaged to place the switch in the MANUAL Mode.

The remote start command consists of a CRANK Signal from the pump controller. When the pump has started, the CRANK TERMINATE Signal is sent to the pump controller to indicate that the engine is running and to discontinue the CRANK Signal. **NOTE:** How the crank and crank terminate signals are displayed depends upon the fire pump control panel manufacturer. This indication should be checked in the event that an automatic start is initiated. If the signal is not present, the engine can be started locally using the Local Starting Procedure in this section.

To start the engine from the Fire Pump Controller Panel:

- 1. Place the AUTO/MANUAL Mode Switch on the operator's Instrument Panel in the AUTO Mode position. Refer to Figure 5-1.
- 2. Start the engine by initiating an engine CRANK Signal from the Fire Pump Controller.
  - a. When the engine starts, a CRANK TERMI-NATE Signal is sent to the fire pump control panel, indicating that the engine is running.

- 1. AUTO/MANUAL Mode Switch
- 2. STOP/RESET Switch
- 3. Low Oil Pressure Warning Lamp
- 4. Battery A/B Switch
- 5. Overspeed Warning Lamp

## Figure 5-1 Instrument Panel Switch Module

# CAUTION

If the Crank Terminate Signal is absent, the engine starter motor will continue to operate. Shut the engine off immediately to avoid damaging the starter motor or the starter motor gears.

- b. If the signal is not present, the engine can be started locally using the Local Starting Procedure in this section.
- 3. The engine continues to operate as long as the RUN signal is present. When the RUN signal is terminated by the fire pump control panel, the engine stops immediately.
- 4. The engine may be stopped locally by pressing the STOP/RESET Rocker Switch.

## 5.4 Local Starting Procedure

The fire pump engine can be started locally from the operator control panel for testing and maintenance. To start the engine from the Operator Control Panel:

1. Place the ECM A/B Selector Switch in the desired operating position (ECM A is the normal position, ECM B is the alternate position). Refer to Figure 5-2.

**IMPORTANT:** Never switch from ECM A to ECM B while the engine is running.

ECM Selector Panel 2.

- 2. Disengage the AUTO/MANUAL Mode Switch Locking Button.
- 3. Place the AUTO/MANUAL Mode Switch in the MANUAL position. Refer to Figure 5-1.
- 4. Observe the battery voltages displayed on the engine instrument panel. Use the battery with the highest indicated voltage.
- 5. Press either the CRANK BATT A or CRANK BATT B Switch to start the engine.
  - a. Depress the selector switch for up to 15 seconds or until the engine starts. Repeat up to three times if necessary.

## CAUTION

To prevent damage to the starter, do not engage the starting motor more than 15 seconds. Wait 15 seconds between each start attempt.

**IMPORTANT:** If the engine does not start after three attempts, check the fuel supply system. Absence of blue or white exhaust smoke during cranking indicates no fuel is being delivered.

- Bypass Raw Water Manual Inlet Valve 1.
- Normal Raw Water Manual Inlet Valve 2.
- 3. Normal Raw Water Manual Outlet Valve
- Bypass Raw Water Manual Outlet Valve 4

## Figure 5-3 Raw Water Manual Valves (open)

**NOTE:** Engines used in fire pumps or standby service are expected to accelerate from crank to full load within a short period of time.

- b. Engine oil pressure must be indicated on the gauge within 15 seconds after starting.
- 6. Stop the engine locally by pressing the STOP/ RESET Rocker Switch.

## 5.5 Emergency Starting Procedure

The engine starts automatically in the event of a fire emergency. However, if it fails to start automatically, the engine can be started locally. The following procedure outlines an Emergency Manual Mode Electrical Start.

- 1. Open both manual bypass valves in the raw water supply loop. Refer to Figure 5-3.
- 2. Place the ECM A/B Selector Switch into the desired operating position. Refer to Figure 5-2.
- 3. Disengage the AUTO/MANUAL Mode Switch Locking Button.
- 4. Place the AUTO/MANUAL Mode Switch on the Operator's Control Panel in the MANUAL position. Refer to Figure 5-1.
- 5. Observe the battery voltages displayed on the engine instrument panel. Use the battery with the highest indicated voltage.
- Press downward on either Battery A or Battery B Contactor Lever to start the engine. Refer to Figure 5-4.
  - a. If Crank Solenoid Lever A does not engage the starter, repeat using Crank Solenoid Lever B.

**IMPORTANT:** If the engine does not start after three attempts, check the fuel supply system. Absence of blue or white exhaust smoke during cranking indicates no fuel is being delivered.

# 

To prevent damage to the starter, do not engage the starting motor more than 15 seconds. Wait 15 seconds between each attempt to start (electrical starting motors only).

- 1. Battery B Starter Contactor
- 2. Battery A Starter Contactor

## Figure 5-4 Manual Starter Contactors

- b. Release the Contactor Lever immediately after the engine starts.
- 7. Check that the engine starts and operates at rated speed.

Engine oil pressure must be indicated on the gauge within 15 seconds after starting.

8. The engine may be stopped locally by pressing the STOP/RESET Rocker Switch.

## 5.6 Engine Operating Speed

The Engine Operating Speed was factory set during manufacturing and test procedures. It may, however, be necessary to adjust the operating speed based on the fire pump application.

If the speed does not match the Engine RPM shown on the Factory Settings Plate, refer to Section 6 for adjustment procedures.

## 5.7 Overspeed Set Point

The Engine Overspeed Set Point was set during manufacturing and test procedures. It may, however, be necessary to adjust the overspeed set point based on the actual fire pump application. Refer to Section 6 - Maintenance for adjustment procedures.

## 5.8 Crank Terminate Set Point

The Crank Terminate Signal informs the pump controller that the engine has started and discontinues the pump controller crank signal. The crank terminate signal was factory set at the manufacturer. Refer to Section 6 - Maintenance for set point adjustment and testing procedures.

## 5.9 ECM Fault Code Lamps

The Electronic Control Module can display and record operation irregularities, which are displayed as fault codes on the operator instrument panel. Fault codes can be read using the two ECM lamps on the operator instrument panel or with an Insite<sup>™</sup> Diagnostic Reader. Refer to Figure 5-5

**NOTE:** Not all engine irregularities are shown as fault codes.

The AMBER engine warning lamp and the RED engine shutdown lamp serve three purposes:

1. An illuminated AMBER Lamp indicates an engine malfunction that requires timely operator attention. Refer to Figure 5-6.

# TERMS

CFP-053

- 1. ECM Harness Connections
- 2. Electronic Control Module (ECM) A
- 3. Diagnostic Reader Plug-ins

## Figure 5-5 ECM Diagnostic Reader Plug-ins

- 2. An illuminated RED Lamp indicates an engine malfunction that requires immediate and decisive operator response.
- 3. To flash out a 3-digit diagnostic fault code, which can then be used to help describe the nature of the engine malfunction. When either of the RED or AMBER lamps is illuminated, the fault code can be determined as follows:
  - a. The AUTO/MANUAL Mode Switch must be placed in the MANUAL position with the engine NOT running.
  - Open the engine control panel and place the Diagnostic ON/OFF Switch in the ON position.
  - c. The RED and AMBER Fault Code Lamps will immediately begin to flash the 3-digit diagnostic code.

The AMBER lamp will blink once to indicate the beginning of a 3-digit code.

- 1. High Coolant Temperature Warning lamp
- 2. Low Oil Pressure Warning Lamp
- 3. Crank Battery A/B Momentary Start Switch
- 4. ECM Engine Shut Down Lamp (red)
- 5. ECM Warning Lamp (amber)
- 6. ECM A/B Indicator Lamps

## Figure 5-6 Instrument Panel Indicator Lamps

For example: For a fault code of 241, the RED Lamp will blink 2 times to indicate the first digit, pause, blink 4 times to indicate the second digit, pause, then blink 1 time to indicate the third and final digit.

The AMBER lamp will then flash once, indicating the end of the three digit code.

- 4. If there is more than one fault code present, press the INC/DEC Toggle Switch to the INC position to proceed to the next 3-digit fault code. Refer to the Fault Code Chart to identify the 3digit code.
- 5. If the Diagnostic Switch is placed in the ON position and both the RED and AMBER Lamps remain lit (do not flash), then there are no active fault codes present.

**IMPORTANT:** Return the Diagnostic Switch to the OFF position before attempting to start the engine.

## 5.10 Isolated Acceptance Testing

The following tests demonstrate the MANUAL Local Start, operation, and shutdown of the fire pump from the engine's local Starter Solenoid Controls.

- 1. Demonstrate that the engine will not operate in the event of blown fuses or other faults in the local control panel.
- 2. Demonstrate manual engine speed control.
- 3. Demonstrate manual raw water valve operations to the engine cooling system.
- 4. Demonstrate the manual local start, operation, and shutdown of the fire pump from the engine's control panel.
- 5. Demonstrate that the engine starts, operates at speed, and stops in the event that the fire pump controller is not functioning.
- 6. Demonstrate the start of the fire pump engine using each battery set separately.

- 7. Demonstrate that the fire pump engine alternator operates while the engine is running.
- 8. Demonstrate that any customer supplied battery charging systems operate when the engine is not running.
- 9. Demonstrate engine start-up, operation, and shutdown of the engine with each of the redundant ECM.
- 10. Check that engine fault codes are not being set during normal operations.

## 5.10.1 Integrated Acceptance Testing

The following tests outline integrated acceptance testing.

- 1. Demonstrate the start-up, operation, and shutdown of the fire pump engine in response to operations of the customer-installed fire pump controller. Perform this testing with the testing of the fire pump controller.
- 2. Demonstrate that the fire pump controller provides design indications and/or alarms for simulated engine oil pressure, water temperature, and overspeed faults.
- 3. Demonstrate the actual operation of the crank terminate output from the overspeed switch.
- 4. Participate in any flushing, pressure testing, flow testing, or capacity testing required for the fire protection system.
- 5. Complete the Cummins Fire Power Start-Up Inspection (SUI) Checklist. This is available on the Cummins Fire Power web site www.CumminsFirePower.com).
- 6. When these items have been demonstrated, contact operating personnel responsible for fire protection system that engine is ready for service.

# **Section 6 - Maintenance**

## 6.1 Introduction

Before performing maintenance procedures, read and understand the Safety Section of this manual. Improper performance or lack of critical information could result in personal injury or equipment damage.

Cummins encourages our customers to perform maintenance and repairs whenever necessary. However, servicing complex components within the normal warranty period may void the Cummins warranty and any specified warranty extended by the manufacturer of OEM products.

Cummins recommends that the engine be maintained according to the Maintenance Schedule in this Section.

Maintenance procedures should be performed by skilled technicians, who are familiar with the equipment, local regulations and service procedures for fire pump engine and pump systems. Improper maintenance can damage the engine, the fire pump or cause severe personal injury.

**IMPORTANT:** If your engine is equipped with a component or accessory not manufactured by Cummins Inc, refer to the component manufacturer's Vendor supplied literature for specific maintenance recommendations.

## 6.2 Engine Operation Report

The engine must be maintained in top mechanical condition if the operator is to get optimum satisfaction from its use. The maintenance department needs daily running reports from the operator to make necessary adjustments in the time allocated. The weekly running report also helps to make provisions for more extensive maintenance, as the reports indicate the necessity.

Comparison and intelligent interpretation of the weekly report, along with a practical follow-up action, will eliminate most failures and emergency repairs. Report to the maintenance department any of the following conditions:

- 1. Low engine oil pressure.
- 2. Low power.
- 3. Power increases or engine surge.
- 4. Erratic or no speed control or frequent shutdowns.
- 5. Any warning lamps flashing or staying illuminated.
- 6. Abnormal water or oil temperature.
- 7. Unusual engine noise.
- 8. Excessive smoke.
- 9. Excessive use of coolant, fuel, or engine oil.
- 10. Any fuel, water-cooling loop, engine coolant, fuel or engine oil, leaks.
- 11. Loose or damaged parts.
- 12. Worn or damaged belts.

Date	Hours or Time Interval	Actual Hours	Check Performance	Performed By:	Comments

## 6.3 Weekly Maintenance

When the engine is running, to be alert for mechanical problems that could create unsafe or hazardous conditions.

## 6.3.1 General Walk Around Inspection

The following areas should be inspected weekly to maintain safe and reliable operation.

- 1. Check fluid levels, oil pressure and coolant temperatures frequently. Most engine problems give an early warning.
  - a. Look and listen for changes in engine performance, sound, or appearance that will indicate that service or repair is needed. Be alert for misfires, vibration, excessive exhaust smoke, loss of power, or increases in oil or fuel consumption.
  - b. Check the engine appearance for excessive heat, wiring short circuits, excessive endplay, vibrations, excessive wear, excessive abrasion, damaged electrical wiring or loose electrical wiring.
  - c. Check the engine for odors of diesel fuel, burning rubber, electrical system failure, exhaust fumes or smoke.

## 

Engine fuel is highly flammable and represents an extreme hazard for fire or explosion when exposed to electric spark or open flame. Clean up spilled fuel immediately. Keep sources of electric spark or open flame away from a fuel source.

## 6.3.2 Air Filter and Piping

- The frequency of cleaning or replacing the air cleaner filter element is determined by the conditions in which the engine operates. Refer to Figure 6-1. Visually inspect the air intake filter and piping daily for blockage, damage to piping, loose clamps, or punctures that can allow debris to enter the engine. Refer to Figure 6-1.
  - a. Some serviceable filter elements can be cleaned and reused if not damaged.

**NOTE:** Cummins recommends using Air Cleaner Element CFP p/n 9606 for Models CFP5E and CFP7E.

- 1. Filter Service Indicator
- 2. Air Cleaner Element

## Figure 6-1 Air Intake Filter

- b. Check that the filter service indicator has not popped up, indicating a filter blockage.
- c. Check for corrosion under the clamps and hoses of the intake system piping. Corrosion can allow corrosive products and dirt to enter the intake system. Disassemble and clean as required.
- 2. Replace damaged air filter or hoses, and tighten loose clamps, as necessary, to prevent the air system from leaking. Torque hose clamps to 8 N-m (72 in-lb).

## 6.3.3 Cooling System

## 

Do not remove a pressure cap from a hot engine. Shut down the engine and wait until the coolant temperature is below 50° C (120° F) before removing the pressure cap. Heated coolant spray or steam can cause severe personal injury.

## CAUTION

Never use a sealing additive to stop leaks in the cooling system. This can result in cooling system plugging and inadequate coolant flow, causing the engine to overheat.

1. Inspect the raw water piping, coolant heat exchanger tanks, charge air cooling system, engine coolant hoses and hose clamps for loose fittings, leaks, holes, damage and corrosion.

- 1. Coolant Fill Cap
- 2. Charge Air Cooler (CAC) Heat Exchanger
- 3. Raw Water Discharge Connection
- 4. Coolant Heat Exchanger/Expansion Tank

## Figure 6-2 Heat Exchanger Tanks

- a. Tighten the hose clamps as necessary.
- b. Check for cracks, holes or other damage. Repair or replace as necessary.
- 2. With the coolant expansion tank at ambient temperature, press down, unscrew and remove the pressure cap. Refer to Figure 6-2.
  - a. Ensure that the coolant level is visible in the coolant level sight gauge.
  - b. Add coolant as required. DO NOT OVER-FILL!

**NOTE:** Supplemental engine coolant should be a mixture of 50% ethylene glycol antifreeze and 50% water to avoid engine damage. Refer to Antifreeze information in Section 6.5.2.

**NOTE:** Cummins recommends using Fleetguard® ES Compleat<sup>™</sup> Ethylene-Glycol (EG) or Fleetguard® Propylene-Glycol (PG) Plus<sup>™</sup> Antifreeze/Coolants. Both products are available in concentrated or premixed formulations. 3. Drain a small amount of coolant from the return line and inspect the coolant for excessive rust or particulate matter. Change the coolant more frequently if particles are present.

# 

Do not mix coolant brands or chemical solutions, as this could damage the cooling system. Keep a record of the coolant concentration and manufacturer with the engine maintenance records.

- Check for soft, overly pliant hoses, oxidation, and loose hose clamps. Torque hose clamps to 8 N-m (72 in-lb). Replace damaged hoses and clamps as required.
- 5. Check the heat exchanger for leaks, damage, and dirt buildup. Clean and repair as required.

## 6.3.4 Engine Oil System

## WARNING

Perform the specific checks in this section only after the engine is fully stopped. Unless tests require engine operation, disconnect the battery leads from the batteries (negative terminal first). Contact with exposed or moving components can cause severe personal injury.

# 

Never operate the engine with oil level below the L (low) mark or above the H (high) mark. Poor engine performance or engine damage can occur.

- 1. For accurate dipstick readings, shut off the engine and wait approximately 10 minutes to allow the oil in the upper portions of the engine to drain back into the crankcase.
- 2. Check the oil level at the engine dipstick. Refer to Figure 6-3.
  - a. If the oil level is excessively high, refer to Oil Level Rises in Section 7 Troubleshooting.
  - b. If the oil level is greater than the high mark (H), drain excess oil and recheck the level.

- 1. Engine Oil Fill Port
- 2. Engine Oil Level Dipstick

#### Figure 6-3 Oil Level Dipstick and Oil Fill Port

- c. If the oil levels are consistently below normal after a fill, check for leaks, loose or damaged gaskets, or oil in the water system. Trouble-shoot per Engine Oil Consumption Excessive in Section 7 Troubleshooting.
- 3. If the oil level is below the low mark (L), add the equivalent type oil.

Keep the oil level as near as possible to the "full" mark on the dipstick by adding the same quality and brand of oil.

**NOTE:** Cummins recommends using Valvoline® Premium Blue S.A.E. 15W-40 Multi-viscosity Engine Oil or equivalent. Refer to the oil change interval and the procedures in Section 6.4.5 Engine Oil and Oil Filter Change.

#### 6.3.5 Fuel System Inspections

## WARNING

Engine fuel is highly flammable and represents an extreme hazard for fire or explosion when exposed to electrical sparks or open flame. Clean up spilled fuel immediately. Keep sources of electrical spark or open flame away from a fuel source.

- 1. Fuel Pre-Filter/Water Separator Canister
- 2. Drain Valve

#### Figure 6-4 Engine Fuel Pre-Filter/Water Separator

- 1. Shut off the engine.
- 2. Inspect the fuel supply line, return line, primary filter, pre-filter/water separator and fittings for cracks or abrasions.
  - a. Ensure the lines are not rubbing against anything that could damage the fuel system hoses. Repair any leaks or alter line routing to eliminate wear immediately.
  - b. Relieve fuel line pressure by carefully loosening the fuel inlet line.
- 3. Drain the Fuel Pre-Filter/Water Separator.

**NOTE:** A Water Separator must be integrated into the fuel delivery system of the fire pump engine. A Fuel Filter/Water Separator may be installed directly on the unit in the primary fuel filter location, or a separate Fuel Pre-Filter/Water Separator may be installed near the fire pump engine assembly.

- a. Open the drain valve: Turn the valve counterclockwise approximately 3-1/2 turns until the valve drops down 25.4 mm (1 in.) and draining occurs. Drain the Fuel Pre-Filter/Water Separator until clear fuel is visible. Refer to Figure 6-4.
- b. Close the drain valve: Lift the valve and turn it clockwise until it is hand-tight. Do not overtighten the valve. Overtightening can damage the threads.
- c. Dispose of the contaminated fuel in accordance with local environmental regulations.

**NOTE:** Cummins recommends using Fleetguard (Cummins) fuel filter FF5612 or equivalent in the primary fuel filter location, and Fleetguard (Cummins) fuel filter/water separator FS19732 or equivalent in the pre-filter location.

## 6.3.6 Engine Exhaust System

With the engine operating, inspect the entire exhaust system including the exhaust manifold, exhaust flex pipe, muffler and piping.

Check for leaks at all connections, welds, gaskets and joints, and make sure that the exhaust pipes are not heating surrounding areas excessively. Repair any leaks immediately.

## 6.3.7 Electrical Supply and Controls

Check the terminals on the starting batteries for clean and tight connections. Loose or corroded connections create resistance which can hinder starting.

## 6.3.8 Crankcase Breather

- Inspect the crankcase breather for a worn or damaged hose, sludge, blockage, or dirt buildup. Refer to Figure 6-5.
- 2. Clean the breather if obstructed or blocked. Replace worn or damaged breather as required.

- 1. Flywheel Housing
- 2. Crankcase Breather

Figure 6-5 Crankcase Breather

CFP-128

- 1. Bypass Water Line
- 2. Normal Water Line
- 3. Raw Water Wye Strainers

#### Figure 6-6 Raw Water Wye Strainers (optional raw water manifold)

## 6.3.9 Clean Raw Water Strainers (optional raw water manifold)

The (2) raw water wye strainers (one on the normal line and 1 on the bypass line) should be cleaned weekly, to remove sediment. Refer to Figure 6-6.

To clean the normal line wye strainer, ensure that the normal line valves are closed and the bypass line valves are open.

To clean the bypass line wye strainer, ensure that the bypass line valves are closed and the normal line valves are open.

- 1. For each raw water strainer, remove the plug.
- 2. Inspect and remove any debris.
- 3. Install the strainer plugs.
- 4. When finished, open the normal line valves and close the bypass line valves

- 1. Battery Cell Covers
- 2. Negative Battery Terminal
- 3. Positive Battery Terminal

## Figure 6-7 24 VDC Battery Connection (optional)

## 6.3.10 Check Battery Condition

Weak or undercharged starting batteries are the most common cause of standby power system failures. Even when kept fully charged and maintained, leadacid starting batteries are subject to deterioration over time and must be periodically replaced when they no longer hold a proper charge.

Only a regular schedule of inspection and testing under load can prevent engine starting problems. Use a manual battery load tester to verify the condition of each starting battery. Inspect the condition of the batteries, the electrical cables and the engine ground lug. Refer to Figure 6-7.

## CAUTION

Batteries can emit explosive gases during charging. To reduce the possibility of personal injury, always ventilate the battery compartment before servicing the batteries.

To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

 Keep the batteries clean by wiping them with a damp cloth whenever dirt appears excessive. Refer to Figure 6-7.

- 2. Use a battery hydrometer to check the specific gravity of the electrolyte in each battery cell. A fully charged battery will have a specific gravity of 1.260. Charge the battery if the specific gravity reading is below 1.215.
- Check battery wiring and cable connections for loose, corroded, worn or damaged cables. Include both connectors at the alternator, battery connections and engine grounding lug (near starter motor).
  - a. If the battery cables are corroded, remove the battery cable clamps, starting with the (-) negative battery cable.
  - b. Use fine emery cloth or a wire brush to clean the cable clamps and battery cables. The metal should be shiny.
  - c. Wash the battery terminals with a solution of baking soda and water (1/4 lb. baking soda to one quart of water).
  - d. Be careful to prevent the solution from entering the battery cells, and flush the batteries with clean water when done.
  - e. After cleaning the connections, coat the terminals with a light application of petroleum jelly.
  - f. Reinstall and tighten the cable clamps.

## WARNING

Battery electrolyte (sulfuric acid) is highly caustic and can burn clothing, the skin or cause blindness. Wear protective clothing, impervious neoprene gloves, safety goggles or full-face shield, when working with the batteries.

- 4. Check the electrolyte level in the batteries monthly. If low, fill the battery cells to the bottom of the filler neck with distilled water.
- 5. Check for continuity between terminals using a digital multimeter or other test equipment. Check also the insulation resistance to ground. Correct any electrical faults.

Continuity should be in the single digit ohms or less. Resistance to ground should be in the mega-ohm range. Refer to the Vendor supplied literature for additional information.

## 6.3.11 Engine Run Testing

Fire pump engines on continuous standby must be able to go from a cold start to being fully-operational in a matter of seconds. This can impose a severe burden on engine parts. The engine normally starts automatically in an emergency situation, upon receipt of the start command from the fire pump controller.

Regular operation keeps engine parts lubricated, prevents oxidation of electrical contacts, uses up fuel before it deteriorates, and, in general, helps provide reliable engine starting.

- Start at least once a week for a minimum of 30 minutes with as much load as possible. Periods of no-load operation should be held to a minimum, because unburned fuel tends to accumulate in the exhaust system.
- 2. Refer to the instructions in Section 5 Operation.
- 3. Check that the engine starts and operates at the recommended fire pump speed specification.
- 4. Engine oil pressure must be indicated on the gauge within 15 seconds after starting.
- 5. Run the engine no less than 30 minutes to attain normal running temperature. Observe that the engine is operating at proper operating speed.
- 6. Check unusual engine noise. Listen for any unusual engine noise which can indicate that service is required.
- 7. Ensure oil pressure is greater than 10 PSI.
- Check coolant temperature between 70° C (158° F) and 107° C (225° F).
- Check that both battery voltmeters indicate 12 VDC for standard or 24 VDC for optional operating systems.
- 10. Check that the inlet air restriction indicator has not popped-up; indicating an air filter blockage. Replace the air filter as required.
- 11. End test run by pressing and holding the Overspeed RESET/STOP Switch until the engine stops.

Figure 6-8 Engine Heater

## 6.3.12 Engine Heater

**NOTE:** Perform this inspection procedure 24 hours after shutting off the engine.

The engine coolant heater must maintain an engine coolant temperature of 49° C (120° F) or above. The engine block must be warm to the touch in the water jacket areas. Refer to Figure 6-8.

If the heater does not appear to be working correctly, contact a Cummins Authorized Repair Location.

## 6.3.13 Check Antifreeze

Antifreeze is essential in any climate. It broadens the operating temperature range by lowering the coolant freezing point and raising its boiling point. The corrosion inhibitors also protect the cooling system from corrosion and provide longer component life.

## CAUTION

**Coolant is toxic. Avoid prolonged and repeated** contact with used antifreeze - wash skin thoroughly after contact. Prolonged, repeated contact can cause skin disorders. Dispose of waste antifreeze in accordance wit local environmental regulations.

## 

Over concentration of antifreeze or use of highsilicate antifreeze can damage the engine. Do not use more than 50% antifreeze in the mixture unless additional freeze protection is required. Antifreeze at 68% concentration provides the maximum freeze protection, and must never be exceeded under any condition. Antifreeze protection decreases above 68%. 1. Check the antifreeze concentration using a refractometer (such as Fleetguard® Part No. CC2800.

**IMPORTANT:** Floating-ball type density testers or hydrometers are not accurate enough for use with heavy-duty diesel cooling systems.

- a. At least twice per year.
- b. At every subsequent oil drain interval, if the concentration is above 3 units.
- c. Whenever coolant is added to the cooling system between filter changes.

## 6.3.14 Air Cleaner Service Indicator

Turbocharged engines must be operated at rated RPM and full load to check maximum intake air restriction. Replace the air filter per the manufacturer's recommendation as required.

## 

Never operate the engine without an air cleaner. Intake air must be filtered to prevent dirt and debris from entering the engine and causing premature wear. Dirt or foreign objects could cause engine damage. Contact with exposed or moving components can cause personal injury.

**IMPORTANT:** Maximum intake air restriction is 762 mm  $H_2O$  (25.0 in  $H_2O$ ) for turbocharged engines.

**NOTE:** Follow the manufacturer's instructions when cleaning or replacing the air cleaner element. Do not remove the felt washer from the indicator. The felt washer absorbs moisture.

- 1. The air cleaner service indicator is actuated when excessive air restriction has occurred at the air cleaner. Refer to Figure 6-9.
  - a. If the red indicator flag is at the raised position in the window, clean or replace the air filter per the manufacturer's recommendation as required.

**NOTE:** Cummins recommends using Air Cleaner Element CFP p/n 9606 for Models CFP5E and CFP7E.

b. After the air cleaner has been serviced, push the flag IN, to reset the service indicator.

- 1. Air Cleaner Service Indicator
- 2. Air Filter Element

## Figure 6-9 Air Cleaner Service Indicator

## 6.4 Annual Maintenance

All checks or inspections listed under previous maintenance intervals must also be performed at this time, in addition to those listed under this maintenance interval.

## 6.4.1 Electrical Components

**AVOID** SERVICING complex components such as: ECM controllers, printed circuit boards, and, programmable controllers, not specifically authorized by the manufacturer. Contact the local Cummins Authorized Repair Location before performing any extensive maintenance.

## 

To reduce the possibility of arcing, remove the negative (-) battery cable first and attach the negative (-) battery cable last.

- 1. Remove the battery terminal cables, starting with the (-) negative cable first.
- 2. Inspect the electrical wiring harness, terminal panels, and electrical plug-ins, for secure, clean electrical contacts, worn or damaged insulation, burnt wires, broken wires and loose connections. Refer to Figure 6-10.
  - a. Clean and tighten any loose electrical connections.

CFP-132

- 1. Operator's Control Panel
- 2. ECM Selector Panel and Switch
- 3. ECM B
- 4. ECM A

## **Figure 6-10 Electrical Control Modules**

- b. Replace worn, damaged, burnt or poorly insulated wiring immediately.
- c. Refer to the OEM Vendor supplied literature for recommended maintenance procedures.

**IMPORTANT:** Solid state or sealed electrical components have no user serviceable parts. Contact your local Cummins Authorized Repair Location for additional information.

- d. Repair or replace damaged components using recommended Recon® or Cummins service parts only. Refer to Section 8 - Component Parts and Assemblies or contact a Cummins Authorized Repair Location.
- 3. Inspect electrical terminal connectors on the instrument panel for burnt, loose, damaged or broken contacts.

4. Inspect the function of all gauges, voltmeters, switches, warning lamps and circuit breakers. Replace panel components, breakers and warning lamps as required.

## 6.4.2 Turbocharger Mounting Nuts

Check the turbocharger mounting nuts. Refer to Figure 6-11.

Torque the mounting nuts to 65 N-m (50 ft-lb).

- 1. Turbocharger
- 2. Exhaust Flex Connection
- 3. Turbocharger Mounting Nuts (4)
- 4. Air Hose to Charge Air Cooler
- 5. Intake Air Cleaner

## Figure 6-11 Turbocharger

## 6.4.3 Engine Mounting Bolts

Loose engine mount bolts or damaged brackets can cause engine misalignment or excessive vibration. These conditions can cause engine or pump damage.

- 1. Inspect all engine mounts for cracks or loose bolts. Refer to Figure 6-12.
- 2. Check the torque on the engine mounting bolts. Torque the support bracket to engine mounting cap screws to 47 N-m (35 ft-lb).

- 1. Flywheel Housing
- 2. Engine Mounting Bracket

#### Figure 6-12 Engine Mounting Bracket

#### 6.4.4 Inspect Fuel Pump and Filters

- 1. Inspect the fuel injection pump mounting nuts, including the support bracket, for loose or damaged hardware. Refer to Figure 6-13.
- Inspect the fuel line hoses and fuel filters for wear, damage, loose fittings, and leaks. Repair or replace damaged hoses and filters as required.

- 1. Primary Fuel Filter
- 2. High Pressure Fuel Pump
- 3. Fuel Pre-Filter/Water Separator

## Figure 6-13 Fuel Pump and Filters

#### 6.4.5 Engine Oil and Oil Filter Change

Engine oil becomes contaminated and essential oil additives are depleted with use. The amount of contamination is related to the total amount of fuel and oil consumed. Change the oil at least once annually.

**NOTE:** For composite oil pans, always use a new sealing washer on the oil drain plug. Hold the external locking nut in place while tightening the oil drain plug.

1. Change the oil and the oil filter to remove the contaminants suspended in the oil.

**IMPORTANT:** If the engine oil is drained from the oil pan to make an engine repair, new oil must be used. Do not use oil that has been drained from the oil pan.

**NOTE:** *Cummins does not recommend exceeding* 600 hours on oil change intervals.

## WARNING

To reduce the possibility of personal injury, avoid direct contact of hot oil with your skin. Some state and federal agencies have determined that used engine oil can be carcinogenic. Prolonged, repeated contact can cause skin disorders or other bodily injury. Wash thoroughly after contact. Avoid inhalation of vapors, and ingestion of used engine oil. Dispose of the oil in accordance with local environmental regulations.

- 2. Operate the engine until the water temperature reaches 70° C (158° F). Shut the engine off.
- Place an appropriate container with a 5 gallon (19 L) minimum capacity under the oil pan drain plug. Refer to Figure 6-14.
- 4. Remove the oil drain plug and drain the oil immediately to make sure all the oil and suspended contaminants are removed from the engine.
- 5. Remove the oil filter. Refer to Figure 6-14.
  - a. Clean the area around the engine oil filter canister.
  - b. Use a filter wrench to remove the filter.

- 1. Oil Filter
- 2. Oil Pan
- 3. Oil Drain Plug

## Figure 6-14 Oil Pan Drain Plug and Oil Filter

- c. Remove and discard the O-ring seal if it has remained attached to the mounting flange. Clean the filter, mounting flange with a clean lint-free cloth.
- d. Apply a light film of 15W-40 oil to the replacement filter gasket before installing the filter.
- 6. Fill the oil filter with a high-quality 15W-40 multiviscosity engine oil, such as Cummins Premium Blue®, or its equivalent.
- Center the filter on the threaded mounting nipple. Screw the filter canister onto the mounting flange until the gasket is snug against the mounting flange. Tighten the filter an additional 1/4 turn.

## 

## Mechanical over tightening can distort the threads or damage the filter element seal.

**NOTE:** *Cummins recommends using Fleetguard Lube Oil Filter LF3970.* 

8. Check and clean the oil pan drain plug threads and sealing surface. Install the oil pan drain plug. Torque the plug to 50 N-m (37 ft-lb).

- 1. Oil Fill Port
- 2. Oil Level Dipstick

## Figure 6-15 Oil Level Dipstick and Oil Fill Port

- 9. Add a high-quality 15W-40 multi-viscosity engine oil, such as Cummins Premium Blue®, or its equivalent.
- 10. Fill the engine to the proper level with clean oil at the fill port. Refer to Figure 6-15.

The CFP5E engine models have a 3.2 gallon (12 L) oil capacity.

The CFP7E engine models have a 4.0 gallon (15.1 L) oil capacity.

**NOTE:** Capacities assume standard pan. Total system assumes standard pan plus filter.

## 

*If no oil pressure is noted within 15 seconds after the engine is started, shut down the engine to reduce the possibility of internal damage.* 

- 11. Stop the engine.
- 12. Wait approximately 15 minutes to let the oil drain from the upper parts of the engine.
- 13. Check the oil level again. Add oil as necessary to bring the oil level to the H (high) mark on the dipstick. Refer to Figure 6-15.

## 6.4.6 Change Fuel Filters

## WARNING

Engine fuel is highly flammable and represents an extreme hazard for fire or explosion when exposed to electrical sparks or open flame. Clean up spilled fuel immediately. Keep sources of electrical spark or open flame away from a fuel source.

## 

Do not open the fuel filter/water separator drain valve or dismantle the fuel lines on the high-pressure fuel system with the engine running. High pressure fuel spray from and operating engine can cause serious personal injury, fire hazard or fatality.

- 1. Shut off the engine.
- 2. Close any OEM fuel valves (if equipped) to prevent fuel from draining or siphoning.
- 3. Clean the area around the fuel filter head.
- 4. Remove the spent filter canister using a filter wrench. Refer to Figure 6-16.

- 1. Primary Fuel Filter
- 2. High Pressure Fuel Pump
- 3. Fuel Pre-Filter/Water Separator

## Figure 6-16 Fuel Filter and Pre-Filter/Separator

- 5. Clean the filter mounting head surface of sludge buildup and foreign particles. Ensure mating gasket surfaces are clean.
- 6. Lubricate the gasket seal with clean S.A.E. 15W-40 engine oil.

**NOTE:** Cummins recommends using Fleetguard (Cummins) fuel filter FF5612 or equivalent in the primary fuel filter location, and Fleetguard (Cummins) fuel filter/water separator FS19732 or equivalent in the pre-filter location.

7. Center the filter ring on the threaded mounting nipple. Screw the filter canister onto the mounting flange until the gasket is snug against the mounting flange. Then tighten an additional 1/4 turn.

## 

## Mechanical over tightening can distort the threads or damage the filter element seal.

- 8. Open the fuel supply valves (optional).
- 9. Press either the CRANK BATT A or CRANK BATT B Switch to start the engine.
- 10. Depress the selector switch for up to 15 seconds or until the engine starts. Repeat up to three times, if necessary.

## 

To prevent damage to the starter, do not engage the starting motor more than 15 seconds. Wait 15 seconds between each start attempt.

**IMPORTANT:** If the engine does not start after three attempts, check the fuel supply system. Absence of blue or white exhaust smoke during cranking indicates no fuel is being delivered.

**NOTE:** Engines used in fire pumps or standby service, are expected to immediately ramp accelerate from crank to full load.

## 6.4.7 Output Shaft Lubrication

It is recommended that proper lubrication to drive shafts and output shafts is to be completed on a regular schedule.

Figure 6-17 Drive Coupling Grease Fittings

- 1. Remove the output shaft guards.
- 2. Wipe the grease fittings and grease gun nozzle with a clean cloth to avoid contamination.
- 3. Add grease to the universal joint grease fittings. Refer to Figure 6-17.

**NOTE:** Cummins, Inc recommends using a good quality semi-synthetic, molybdenum-fortified NLGI #2 lithium complex grease which protects from -54° to 400° F such as Valvoline Durablend®.

4. Wipe excess grease from the grease fittings.

## 

Before equipment operation, ALL guards, covers and protective devices MUST BE in place and securely fastened. Serious personal injury could result from contact with exposed or moving components.

## 6.4.8 Engine Operation Checks

The following service procedures ensure that the engine starts and operates properly under normal conditions.

## 6.4.8.1 Crank Termination Set Point

The Speedswitch Crank Termination Set Point is factory set at 650 rpm, and should not be changed from this value. Refer to Figure 6-18.

If the crank termination set point must be set, proceed as follows:

1. Open the engine control panel and remove the crank terminate potentiometer cover.

There will be 2 potentiometers visible. The Crank Terminate Potentiometer is the upper one.

- 2. This is a 30-turn potentiometer. The Crank Terminate Potentiometer must be set to 14 turns clockwise.
- 3. To ensure that the potentiometer is set at 0 turns: Rotate the potentiometer 30 turns counterclockwise. The potentiometer will not be damaged by turning it past its zero-point.
- 4. After setting the Crank Terminate Potentiometer at 0 turns, turn the potentiometer 14 turns clockwise.

- 1. Spring Clamp Terminal Blocks
- 2. Speed Increase/Decrease Toggle Switch
- 3. RESET Button
- 4. TEST Button
- 5. Diagnostic ON/OFF Toggle Switch
- 6. CRANK Termination or RUN Signal Indicator LED (Factory Use Only)
- 7. Overspeed Indicator LED
- 8. Pre-wired Terminals
- 9. Crank Terminate Potentiometer Cover
- 10. Overspeed Potentiometer Cover

## Figure 6-18 Engine Overspeed Control Module

5. Replace the cover. The Crank Terminate Potentiometer is now set at approximately 650 rpm.

## 6.4.8.2 Engine Speed Calibration

If the speed does not match the Engine RPM shown on the Factory Settings Plate, use the following method to set the engine speed using the INC/DEC Speed Switch on the engine speed controller panel.

- 1. Remove the cap screw from the operator's instrument face plate, allowing the face plate to gently drop down supported by the hinge.
- 2. Start the engine using the local start method.
- 3. Observe that the engine starts and accelerates to the speed set point listed on the Factory Settings Plate.
- 4. Monitor engine speed on the tachometer. Record the observed engine speed.

If the speed does not ramp up to the setting shown on the Factory Settings Plate, the engine operating speed set point must be calibrated.

5. Move the Engine Speed Toggle Switch to the required INC (increase) or DEC (decrease) pole position. Refer to Figure 6-18.

## NOTE: Each time the Speed INCREASE/

DECREASE Toggle Switch is briefly moved to the minus (-) position, the idle speed is decreased by 10 RPM. When the switch is briefly moved to the plus (+) position, the idle speed is increased by 10 RPM. Holding the toggle switch in either the INC or DEC position ramps the engine speed in the selected direction.

- a. To increase the speed, move the double pole, return-to center, toggle switch to the INC position until the rated speed is reached. Refer to Figure 6-18.
- b. To decrease the speed, move the double pole, return-to center, toggle switch to the DEC position until the rated speed is reached.
- 6. Stop the engine.
- 7. Start the engine.

- 8. Observe that the engine starts and accelerates to the rated speed set point.
- 9. The engine speed set point calibration is required for both the ECM A and ECM B subsystems.
- 10. Repeat steps 2 through 8 while the ECM selector switch is set to ECM-B.
- 11. Close the panel and tighten the enclosure cap screw to secure the panel face.

**IMPORTANT:** Never switch from ECM-A to ECM-B while the engine is running.

## 6.4.8.3 Overspeed Set Point Adjustment

The Engine Overspeed Set Point was set by Cummins Fire Power during manufacturing and test procedures. It may be necessary to adjust the overspeed set point based on the actual fire pump application.

- 1. Open the engine instrument panel and remove the Overspeed Potentiometer Cover. Refer to Figure 6-18.
- 2. Place the engine in the MANUAL position by switching the AUTO/MANUAL Mode Switch to the MANUAL position.

**NOTE:** The Test Button reduces the actual overspeed set point by a value of 20%.

- 3. Start the engine and adjust the engine speed to the system design pump speed. Refer to Section 6.4.8.2 Engine Speed Calibration for additional information.
- Press and hold the test button. If the engine remains running, slowly turn the Over Speed Potentiometer counterclockwise until the engine stops. Remember to keep the test button depressed during this adjustment procedure. The speed switch is now set for the correct overspeed RPM.

**NOTE:** Turning the potentiometer clockwise raises the set speed and counterclockwise lowers the set speed.

5. Press the Reset button on the speed switch or front panel so the engine can be restarted.

**IMPORTANT:** The final pump speed is typically set while the pump is flowing 150%.

## Alternate Overspeed Set Point Adjustment procedure (without the test button)

- 1. Remove the drive-shaft or stub-shaft coupling to prevent overspeeding the pump. Refer to appropriate driveline drawings in Section 8 Component Parts and Assemblies.
- 2. Open the engine instrument panel and remove the Overspeed Potentiometer Cover. Refer to Figure 6-18.
- 3. Place the engine in MANUAL position by switching the AUTO/MANUAL Mode Switch to the MANUAL position.
- 4. Calculate the actual overspeed setting.
  - a. Determine required pump speed (example: 1760 RPM).
  - b. Calculate actual overspeed setting (example: 1760 X 120% = 2112 RPM).
- 5. Start the engine and adjust the engine speed to the calculated overspeed. (2112 RPM in the example above). Refer to Section 6.4.8.2 Engine Speed Calibration for additional information.
- 6. If the engine remains running, slowly turn the Over Speed Potentiometer counterclockwise until the engine stops. The speed switch is now set for the correct overspeed RPM.

**NOTE:** Turning the potentiometer clockwise raises the set speed and counterclockwise lowers the set speed.

- 7. Press the Reset button on the speed switch or front panel so the engine can be restarted.
- 8. Readjust the engine speed to the proper pump speed (1760 RPM in the example above).
- 9. Reconnect the pump drive-shaft or stub-shaft coupling. Refer to appropriate driveline drawings in Section 8 Component Parts and Assemblies.

**IMPORTANT:** The final pump speed is typically set while the pump is flowing 150%.

## 6.4.9 Coolant Pump/Alternator Belt Inspection

For CFP5E/7E models, a single belt drives both the water pump and the alternator.

## CAUTION

Belt damage can be caused by, incorrect tension, incorrect size or length, pulley misalignment, incorrect installation, severe operating environment, and oil or grease on the belt or pulley.

- 1. Place the AUTO/MANUAL Mode Switch in the MANUAL position.
- 2. Disconnect both batteries at their terminals Remove (-) negative cable first. Install the (-) negative cable last.

# 

Disconnect both batteries (negative cable first) before performing service on the Fire Pump Engine or on any of its controls.

 Remove the belt guard bolts and the belt guard. Set aside for later installation. Refer to Figure 6-19.

- 1. Drive Belt
- 2. Idler Pulley
- 3. Coolant Pump Pulley
- 4. Damper Pulley
- 5. Belt Tensioner
- 6. Alternator Pulley

## Figure 6-19 Coolant Pump/Alternator Belt

4. Visually inspect the belt for frayed, worn, missing pieces or cracked belt surfaces. Check the belt for intersecting cracks. Refer to Figure 6-19.

**NOTE:** Transverse cracks (across the belt width) are acceptable. Longitudinal cracks (direction of belt length) that intersect with transverse cracks are not acceptable. Replace the belt if it is cracked, frayed or has pieces of material missing.

5. If the belt condition is acceptable, check the belt tension.

**NOTE:** Belts with glazed or shiny surfaces indicates belt slippage. Correctly installed and tensioned belts will show even pulley and belt wear.

## 6.4.10 Coolant Pump/Alternator Belt Tension

## 

Disconnect batteries (negative cable first) before performing service on the Fire Pump Engine or on any of its controls.

- 1. Check the drive belt tension. Refer to Figure 6-19.
- Use the Cummins belt tension gauge, Part No. 3822524, to accurately measure the drive belt tension.

**NOTE:** For cogged drive belts, make sure the belt tension gauge is positioned so the center tensioning leg is positioned directly over a high point (hump) of a belt cog. Positioning the center leg elsewhere on a belt cog will result in incorrect measurement.

- a. Measure the belt tension in the center span of the belt between the alternator and idler pulleys.
- b. Belt tension should be between 18 149 N-m (60-110 ft-lb).
- 3. The deflection method can also be used to measure drive belt tension.
  - a. Measure the belt tension in the center span of the belt between the alternator and idler pulleys.
  - b. Apply 110 N-m (25 ft-lb) of force on the belt.

c. If belt deflection is more than one belt thickness per foot of pulley center-to-center distance, adjust the belt tension.

#### 6.4.11 Heat Exchanger Pressure Test

**NOTE:** This test is required if internal leakage in the heat exchanger is suspected. It may be performed prior to the removal from the engine.

**NOTE:** Use Teflon tape or other pipe sealant when installing the test setup in order to prevent leaks.

- 1. Install a 1" NPT tubing adapter at the raw water outlet of the heat exchanger.
- 2. Install a pressure test setup with 700 kPa (100 psi) pressure gauge to the 3/4" tubing adapter raw water inlet on the heat exchanger.
- 3. Apply air pressure at 414 kPa (60 psig).
  - a. Isolate the pressure source and monitor the pressure gauge for 5 minutes.
  - b. There should be no change in pressure for the duration of the test.
- 4. After testing, release the pressure. Remove the tubing adapters, plug and the test equipment.
- 5. If leakage is detected, the heat exchanger must be replaced.

#### 6.4.12 Turbocharger Inspection

 Visually inspect the air intake filter and piping for dirt buildup, blockage, wear points, soft hoses, loose clamps, or punctures. Refer to Figure 6-20.

Replace damaged air filter or hoses, and tighten loose clamps, as necessary, to prevent the air system from leaking.

- Check that the filter service indicator has not indicated a filter blockage. Clean or replace blocked filters.
- 3. Check for corrosion under the clamps and hoses of the intake system piping. Corrosion can allow foreign particles and dirt to enter the intake system.

Disassemble and clean, as required.

4. Remove the air intake and the exhaust piping.

- 1. Turbocharger
- 2. Exhaust Flex Connection
- 3. CAC Piping
- 4. Intake Air Cleaner

## Figure 6-20 Turbocharger Connections

- 1. Turbocharger Compressor Wheel
- 2. Turbocharger Intake Housing
- 3. Air Intake Tube and Clamp

## Figure 6-21 Turbocharger Turbine Wheel (typical)

- 5. Remove the exhaust pipe from the turbocharger.
- 6. Inspect the turbocharger compressor wheel for cracks in the housing or turbine blades, missing blades, mechanical binding, eccentric motion or excessive end-play. Refer to Figure 6-21

Replace the turbocharger if damage excessive end-play, binding, wear or eccentric motion is found. Contact a Cummins Authorized Repair Location for replacement.

**IMPORTANT:** The turbocharger must be removed for replacement or rebuild, if the clearance is beyond the limits, the housing is cracked or the turbine wheel is damaged.

7. Reinstall the air intake filter and the exhaust piping. Tighten the clamps. Torque loosened clamps to 8 N-m (72 in-lb).

## 6.5 Every 2 Years or 2000 Hours

All checks or inspections listed under daily or previous maintenance intervals must also be performed at this time, in addition to those listed under this maintenance interval.

## 6.5.1 Water Pump Inspection

- 1. Inspect the water pump for eccentric motion, mechanical binding, excessive end play, seal damage and grease or water leakage around the water pump shaft.
- 2. Replace with a new or rebuilt, pre-lubricated unit as necessary. Contact a Cummins Authorized Repair Location for replacement.

## 6.5.2 Drain and Flush Cooling System

The cooling system must be clean to work properly. If the system shows excessive mineral buildup, particulate matter, scale, oxidation or oil contamination, drain and flush the cooling system. If the coolant is excessively dirty or is mixed with oil, contact a Cummins Authorized Repair Facility.

# 

Do not remove the pressure cap from a hot engine. Shut down the engine and wait until the coolant temperature is below 50° C (120° F) before removing the pressure cap. Heated coolant spray or steam can cause severe personal injury.

- CFP-139
- 1. Lower Coolant Hose
- 2. Engine Heater Coolant Hose
- 3. Engine Coolant Heater

#### Figure 6-22 Engine Coolant Drain

- 1. Press down, unscrew and remove the coolant expansion tank pressure/fill cap. The cap must be removed to allow air to vent the cooling system during the draining process.
- Unplug the engine heater power supply before draining the cooling system. Refer to Figure 6-22.
- Place a container that will hold at least 10 gallons of liquid, under the engine heater. Refer to Figure 6-22.
- 4. Disconnect the engine heater coolant hose at the engine heater and allow the coolant to drain into the waste container.
- 5. Flush with clean fresh water or heavy-duty heat exchanger cleaner. Follow the manufacturer's directions on the product container.

**NOTE:** Some cooling system cleaners or commercial solvents require a soapy water rinse after use. Follow the directions on the cleaning solution or solvent.

- 6. If using a soapy water solution, flush again with clear water. Allow time for water to fully drain.
- 7. Reconnect the engine heater coolant hose.

# 

Handling and disposing of used antifreeze can be subject to federal, state, and local laws and regulations. Use authorized waste disposal facilities, including civic amenity sites and garages providing authorized facilities for the receipt of used antifreeze. If in doubt, contact local authorities or the EPA for guidance as to proper handling of used antifreeze.

**NOTE:** During filling, air must be vented from the engine coolant passages. The air vents through the coolant filler port. The system has a design fill rate of 10 liters/minute (2.8 gal/min).

 Fill the coolant tanks with low-silicate antifreeze that meets ASTM 4985 test (GM 6038 M spec.) criteria. Use a mixture of 50% water and 50% ethylene-glycol base or propylene-glycol antifreeze (or pre-mixed solution) to protect the engine to -37° C (-34° F) year-around.

**NOTE:** Cummins Inc. recommends using Fleetguard® ES COMPLEAT<sup>™</sup> Ethylene-Glycol (EG) or Fleetguard® Propylene-Glycol (PG) Plus<sup>™</sup> Antifreeze/Coolants. Both products are available in concentrated or pre-mixed formulations. Use a 50% concentration level (40% to 60% range) of ethyleneglycol or propylene-glycol in most climates. Contact your local Cummins Authorized Repair Location for additional information.

Ethylene-Glycol	Propylene-Glycol
40% = -23° C (-10° F)	40% = -21° C (-6° F)
50% = -37° C (-34° F)	50% = -33° C (-27° F)
60% = -54° C (-65° F	60% = -54° C (-65° F
68% = -71° C (-90° F)	68% = -63° C (-82° F)

## 

Use soft or distilled water in the coolant mixture. Contaminants in hard water neutralize the corrosion inhibitor components. Water must not exceed 300-ppm hardness or contain more than 100 ppm of either chloride or sulfate.

Never use a sealing additive to stop leaks in the cooling system. This can result in cooling system blockage or restricted coolant flow, causing the engine to overheat.

# CAUTION

The system must be filled properly to prevent air locks. During filling, air must be vented from the engine coolant passages.

- 9. Check the condition of the filler cap.
  - a. If the filler cap seal is worn, damaged, missing or the pressure spring is damaged or shows signs of sticking, replace the filler cap.
  - b. Install the expansion tank filler cap.
- 10. Operate the engine until it reaches a temperature of 82° C (180° F), and check for coolant leaks.
- 11. Ensure that the coolant level is visible in the sight gauge.

## 6.6 Every 4 Years or 5000 Hours

All maintenance checks and inspections listed in previous maintenance intervals must also be performed at this time.

Cummins recommends performing maintenance on vale lash settings. The recommended maintenance is beyond the scope of this manual.

## CAUTION

Valve lash maintenance should be performed by a skilled technician. Improper maintenance can damage the engine or cause severe personal injury. Contact your local Cummins Authorized Repair Location before performing any extensive maintenance.

## 6.6.1 Coolant Thermostat Removal/Installation

The thermostat regulates the temperature of the engine coolant circulating through the engine cooling system.

## CAUTION

Always use the correct thermostat, and never operate the engine without a thermostat installed. The engine can overheat if operated without a thermostat because the path of least resistance for the coolant is through the bypass to the pump inlet.

- 1. Remove the upper coolant hose clamps and the upper coolant hose at the thermostat housing.
- 2. Remove the (2) thermostat housing flange cap screws and the thermostat flange. Refer to Figure 6-23.
- 3. Remove the thermostat and gasket from the housing.
- 4. Clean the housing flange faces of dirt buildup, oxidation and sludge.
- 5. Install the thermostat in the housing.

NOTE: EC 9045 Kit contains Cummins approved thermostat and thermostat seal.

- Upper Coolant Hose 1.
- Hose Clamp 2.
- Thermostat Housing 3.

## Figure 6-23 Thermostat Housing

- 6. Install a new thermostat seal on the thermostat housing flange surface.
- 7. Replace the thermostat flange and cap screws.

## 6.6.2 Coolant Pump/Alternator Belt Replacement

Replace the Coolant Pump/Alternator Belt if it is cracked, frayed or has pieces of material missing.

## 

#### Disconnect both batteries (negative cable first) before performing service on the Fire Pump Engine or on any of its controls.

- 1. Remove the belt guard. Refer to Figure 6-24.
- 2. Use a 3/8" drive ratchet or breaker bar to rotate the tensioner arm away from the belt and remove the belt.
- 3. Check the belt tensioner cap screw torque. The screw should be torqued to 43 N-m (32 ft-lb).

- 1. Drive Belt
- 2. Idler Pulley
- 3. Coolant Pump Pulley
- 4. Damper Pulley
- 5. Belt Tensioner
- 6. Alternator Pulley

## Figure 6-24 Coolant Pump/Alternator Belt

- 4. Check the tensioner arm, pulley, and stops for cracks. If any cracks are noticed, the tensioner must be replaced.
- 5. Verify that the tensioner arm stop is not in contact with the spring casing stop.

If either stop is touching, the tensioner must be replaced.

6. Inspect the tensioner for evidence of the tensioner arm contacting the tensioner cap.

If there is evidence of the two areas making contact, the pivot tube bushing has failed and the tensioner must be replaced.

- 7. Check the tensioner bearing.
  - a. Rotate the tension pulley. The pulley should spin freely with no mechanical binding, eccentric motion or excessive end-play.
  - b. If the arm rotates with mechanical binding, eccentric movement or excessive end play, replace the tensioner.
- 8. Inspect the clearance between the tensioner spring case and the tensioner arm for uneven bearing wear.

If the clearance exceeds 3 mm (0.12 in) at any point, the tensioner must be replaced as a complete assembly. Contact a Cummins Authorized Repair Location for replacement.

**NOTE:** Experience has shown that tensioners generally will show a larger clearance gap near the lower portion of the spring case, resulting in the upper portion rubbing against the tensioner arm. Always replace the belt when a tensioner is replaced.

- 9. After checking the torque, use a 3/8" drive ratchet or breaker bar to rotate the tensioner slowly away from the area of belt contact.
- 10. Install the replacement drive belt.

## 

To prevent pulley or belt damage, do not roll a belt over the pulley or pry it on with a tool. Move the tensioner arm away from the belt area before installing the drive belt. 11. Check the location of the drive belt on the belt tensioner pulley. The belt should be centered on, or centered close to the middle of, the pulley.

## CAUTION

Unaligned belts, either too far forward or backward, can cause belt wear, belt roll-off failures, or increase uneven tensioner bushing wear.

12. Reinstall the belt guard.

## 6.6.3 Charge Air Cooler (CAC) Heat Exchanger

The charge air cooler heat exchanger should be removed and cleaned internally at least once every four years.

- 1. Place the AUTO/MANUAL Mode Switch in the MANUAL position.
- 2. Disconnect both batteries at their terminals. Remove (-) negative cable first. Install the (-) negative cable last.

## 

Batteries must be disconnected before performing service on the Fire Pump Engine or on any of its controls. Wear safety glasses when disconnecting batteries!

- 3. Shut off the manual raw water and bypass water valves on the cooling loop water supply.
- 4. Drain the coolant system per the instructions in Section 6.5.2.
- 5. When the tanks are empty, disconnect the inlet and outlet air tubing from the charge air cooler heat exchanger. Refer to Figure 6-25.
- 6. Disconnect raw water inlet and outlet fittings from the charge air heat exchanger and the coolant heat exchanger/expansion tank.
- 7. Disconnect the coolant hoses from the coolant heat exchanger/expansion tank.
- 8. Remove the upper heat exchanger mounting brackets. Refer to Figure 6-25.
- 9. Remove the coolant heat exchanger/expansion tank.

- 10. Remove the middle heat exchanger mounting brackets. Refer to Figure 6-25.
- 11. Remove the charge air cooler heat exchanger.

# WARNING

Cleaning chemicals may be caustic and cause skin irritation. Follow the instructions on cleaning containers for protective clothing. Wear protective clothing, eye wear, and rubber gloves when working with cleaning solutions. Dispose of solvents and cleaning solutions properly.

12. Flush the charge air cooler internally with cleaning solution in the opposite direction of normal air-flow.

# 

Do not use caustic cleaners to clean the charge air cooler. Damage to the charge ar cooler will result. Follow the directions provided by the cleaning solution manufacturer.

13. Shake the charge air cooler and lightly tap on the tank ends with a rubber mallet to dislodge trapped debris. Continue flushing until all debris or oil is removed.

## CAUTION

Wear appropriate eye and face protection when using compressed air. Flying debris and dirt can cause personal injury.

- 14. After the charge air cooler has been thoroughly cleaned of all oil and debris with solvent, wash the charge air cooler internally with hot, soapy water to remove the remaining solvent.
- 15. Rinse thoroughly with clean water.
- 16. Blow compressed air into the charge air cooler in the opposite direction of normal air-flow until the charge air cooler is dry internally.
- 17. Depending on the condition of the heat exchanger, perform the Pressure Test outlined in this section if necessary.
- 18. Reassemble the coolant heat exchangers. Refer to Figure 6-25.

- a. Position the charge air cooler heat exchanger on the lower mounting brackets.
- Beinstall all water supply and drain fittings. Use Teflon<sup>™</sup> pipe tape to prevent leaks. Torque the hose clamp screws to 8 N-m (71 in-lb).
- c. When the charge air heat exchanger hose clamps and cooling water lines are secure, Install the middle mounting brackets and tighten the mounting bracket bolts.
- d. Position the coolant heat exchanger/expansion tank on the middle mounting brackets and tighten the mounting bracket bolts.

- e. Reinstall all water supply, coolant, and drain fittings. Use Teflon<sup>™</sup> pipe tape to prevent leaks. Torque the hose clamp screws to 8 N-m (71 in-lb).
- f. Install the upper mounting brackets and the heat exchanger front plate.
- 19. Open the cooling loop raw water supply manual valves and check for leaks.
- 20. After completing all service work, start the engine and check for air leaks, loose clamps, and blowby.

- 1. Charge Air Tubing to Intake Manifold
- 2. Lower Mounting Bracket (2)
- 3. Middle Mounting Bracket (2)
- 4. Coolant Hose Connections
- 5. Upper Mounting Bracket (2)

6. Coolant Heat Exchanger/Expansion Tank

- 7. Raw Water Connecting Pipe
- 8. Charge Air Cooler Heat Exchanger
- 9. Charge Air Tubing from Turbocharger

## Figure 6-25 Cooling Loop and Heat Exchangers

# **Section 7 - Troubleshooting**

## 7.1 Troubleshooting

The following information is intended as a guide to troubleshooting some common nontechnical equipment problems. Many problems can be resolved using corrective maintenance, adjustment or minor repair. Refer to the Vendor supplied literature, electrical schematics and mechanical prints for additional information.

For engine related issues, refer to Operation and Maintenance Manual, Industrial and Power Generation QSB Engines, Bulletin No. 4021531 or contact the Cummins Customer Assistance Center at 1-800-DIESELS (1-800-343-7357).

It is beyond the scope of this manual to cover all of the various problems that may affect engine performance.

The status checks should be performed ONLY by a qualified technician. Contact with exposed electrical components could cause extreme personal injury or death.

## WARNING

Before equipment operation, ALL guards, covers and protective devices MUST BE in place and securely fastened. Serious personal injury could result from contact with exposed or moving components.

**AVOID** SERVICING complex components such as: printed circuit boards, and, ECM's, not specifically authorized by Cummins Inc. Contact a Cummins Fire Power Customer Service Department toll free at 1-800-343-7357 before performing any extensive maintenance.

## CAUTION

Never climb or stand on the equipment frame, guards, or enclosures. Contact with exposed or moving components can cause personal injury or equipment damage.

#### Troubleshooting Chart

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.1 Alternator Overcharging with the Engine Running	Batteries have failed.	Check the condition of the batter- ies. Replace any defective batter- ies.
<b>NOTE:</b> If the batteries are over- charged while the engine is not running, troubleshoot the customer supplied battery	Voltage regulator malfunction.	Test the alternator electrically. Contact an Authorized Cummins Repair Facility.
charging system.		Replace alternator as necessary.
7.1.2 Neither Battery is Charg- ing with the Engine Running	Battery cables or connections are loose, broken, or corroded (excessive resistance).	Check the battery cables and con- nections. Ensure that all connec- tions are free of corrosion and that no cables are broken.
<b>NOTE:</b> If one or both batteries do not charge with the engine stopped, troubleshoot the customer supplied battery charging system.	Alternator rotor is not rotating.	Test the alternator mechanically. If the alternator shaft does not spin freely because of a bad bear- ing, replace the alternator.
<b>NOTE:</b> If only one battery is main- taining charge, go to Only One Battery is Charging with the Engine Running.		If the alternator does not turn because of a bad drive belt, replace the drive belt. Refer to Section 6 - Maintenance.
		If the alternator does not charge because of poor drive belt ten- sion, adjust belt tension. Refer to Section 6 - Maintenance.
		If the alternator pulley spins freely on the shaft because of a broken key, replace the alternator. Contact an Authorized Cummins Repair Facility.
	Battery isolator input has faulted.	Test continuity from the alternator to the battery isolator input. Repair any open circuit.
		Test continuity through the battery isolator. If an internal open circuit exists, replace battery isolator.
	Alternator excitation is lost.	Test alternator electrically. Replace the alternator diode as necessary.
		Speed Failed - Fused relay
		Locate and repair the open circuit or short to ground in the alternator excitation wiring as necessary.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.2 Neither Battery is Charg- ing with the Engine Running (continued)	Alternator internal voltage regula- tor is malfunctioning.	Test the alternator electrically. If required, replace the alternator. Contact an Authorized Cummins Repair Facility.
7.1.3 Only One Battery is	Battery has failed.	Check battery charge.
Charging with the Engine Running NOTE: If one or both batteries do not charge with the engine	Battery cables or connections are loose, broken, or corroded (excessive resistance).	Check the battery cables and con- nections. Ensure connections clean and that no cables are broken.
stopped, troubleshoot the customer supplied battery charging system. NOTE: If neither battery is main-	Battery isolator has failed.	Remove the battery isolator. Test the internal diodes for open circuit or short to ground. Replace the battery isolator as necessary.
taining charge, go to Neither Battery is Charging with the Engine Running.		
7.1.4 Voltage Indications Differ	Voltmeter is providing false indi- cation.	See Voltage Indications Differ in this section.
<b>NOTE:</b> The two voltmeters may differ slightly due to calibration differences between the meters.	One battery is discharged or fail- ing.	Check battery condition. Replace failing battery elements.
Normal differences in battery con- dition may also cause differences in indication. These are normal		Check wiring for corrosion. Ensure good electrical contact.
differences and require no action.		Charge discharged batteries by running the engine or with an external battery charger. If the battery does not charge with the engine running, go to Only One Battery is Charging with the Engine Running.
		Check for apparent wire damage or shorts to grounds. Replace the failed fuse.
	Circuit Breaker 1 or Circuit Breaker 2 is tripped.	If the circuit breaker trips again, locate and correct the overload or repair the short circuit.
	Open circuit or short to ground in indicator wiring.	Locate and repair the electrical fault.
	Voltmeter has failed.	Remove wiring at the voltmeter and apply test voltage. Replace the faulted voltmeter as neces- sary.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.5 Coolant Contamination	Coolant is rusty and has debris.	Drain and flush the cooling system per the instructions in Section 6 - Maintenance.
		Refill with correct mixture of anti- freeze and water per the instruc- tions in Section 6 - Maintenance.
		Drain and flush the cooling system per the instructions in Section 6 - Maintenance.
	Coolant Heat Exchanger is leaking raw water into the coolant. Coolant volume increases and	Drain and flush the cooling system per the instructions in Section 6 - Maintenance.
	pressure is relieved when the unit is operating. Antifreeze concen- tration decreases.	Perform a pressure test of the raw water side of the heat exchanger. If the heat exchanger leaks, it should be replaced.
		Check and adjust raw water pres- sure regulator set points.
		Check and, if required, replace the zinc plug.
		Refill with correct mixture of anti- freeze and water per the instruc- tions in Section 6 - Maintenance.
	Coolant is inadvertently contami- nated with unknown liquids.	Drain and flush the cooling system. Refill with correct mixture of antifreeze and water per the instructions in Section 6 - Mainte- nance.
		Contact an Authorized Cummins Repair Facility.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.6 Excessive Coolant Loss	Adequate coolant was not added following previous maintenance activities.	Check the coolant level. Add coolant as required and check engine operation. If coolant loss persists, check for other prob- lems.
	Inadvertent coolant leak is present.	Inspect the engine for coolant leaking from drain cocks or vents. Close the leaking drain or vent. Add coolant as required and check engine operation.
	Cooling system hose is leaking.	Check the condition of the hoses. Replace and/or tighten loose hose clamps. Replace any damaged hoses as necessary. Add coolant as required and check engine operation.
	Pressure cap is malfunctioning or has low-pressure rating.	Check that the pressure cap does not relieve coolant under normal operating conditions. Replace a leaking pressure cap, (Cummins Fire Power Part No. 11407). Add coolant as required and check engine operation.
	Mechanical coolant leak.	Inspect the engine for coolant leaking from manifold, expansion and pipe plugs, fittings, engine oil cooler, water pump seal, cylinder block, and other components that have coolant flow. Repair leaking components. Add coolant as required and check engine opera- tion.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.7 Coolant Temperature Above Normal	Engine is overheating.	Refer to the Coolant Temperature Above Normal in this section.
<b>NOTE:</b> The thermostat's normal operating temperature range is 82-95° C (180-203° F) The High Water Temperature lamp on the local control panel. The lamp only illuminates if the engine is	Raw water flow is improperly aligned.	Check that the optional raw water manifold is aligned for normal flow through the solenoid valve (pre- ferred) or bypass flow around the solenoid valve (alternative). Align flow if required.
running. If the lamp is illuminated or if temperature is otherwise excessive, the engine should be stopped as soon as practical and the problem corrected.	Raw water pressure regulator is improperly adjusted. <b>NOTE:</b> <i>Pressure should not</i> <i>exceed 414 kPa [60 psig].</i>	Check the raw water pressure indication. If pressure is indicated but is low, adjust the regulator. If pressure is not indicated or is excessively low, go to raw water solenoid has failed.
	Raw water solenoid has failed.	If pressure is excessively low when aligned for normal flow, open the bypass valves. When practical, troubleshoot the raw water solenoid valve. Refer to Raw Water Solenoid Valve Fails to Operate in this section. If the solenoid valve operates, replace the pressure regulator.
		If pressure is excessively low when aligned for bypass flow, open the normal valves.
		Check the raw water wye strain- ers (optional manifold) for block- age per the instructions in Section 6 - Maintenance. Clean the strainer if necessary.
		Check the raw water piping for blockage. Clean the piping if nec-essary.
	Raw water piping or heat exchanger is plugged.	Remove any blockage. Check for flow through the heat exchanger. Replace the heat exchanger as necessary.
	Coolant level is below specifica- tion.	Check the coolant level. If coolant level is excessively low, go to Excessive Coolant Loss in this section.
	Cooling system hose is collapsed, restricted, or leaking.	Inspect the hoses. Replace any damaged hoses as necessary.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.7 Coolant Temperature Above normal (continued)	Coolant thermostat is malfunc- tioning.	Remove and test the coolant ther- mostat per the instructions in Section 6 - Maintenance. Replace the defective thermostat.
	Coolant pump is malfunctioning.	Remove and inspect the water pump. Replace the defective coolant pump. Contact an Autho- rized Cummins Repair Facility.
	Engine oil is contaminated with coolant or fuel.	Check the appearance of the engine oil. If the color and texture is abnormal, refer to the Engine Oil Contaminated in this section.
	Coolant mixture of antifreeze and water is not correct.	Verify the concentration of anti- freeze in the coolant. Add anti- freeze or water to correct the concentration.
	Engine oil level is above or below specification.	Check the oil level per the instruc- tions in Section 6 - Maintenance.
	Coolant temperature sender is malfunctioning.	Replace the temperature sender as necessary.
	Coolant temperature gauge is malfunctioning.	Replace the temperature gauge as necessary.
	Coolant temperature switch is malfunctioning.	Remove the temperature switch. Test the temperature switch. Repair or replace the switch, if necessary.
7.1.8 Coolant Temperature Below Normal	The standard 120 VAC or optional 240 VAC power supply to the coolant heater is not connected.	Connect the power supply. Correct any electrical faults in the supply circuit.
	The heater's overload thermostat has operated.	Ensure that there is coolant in the heater. Allow time for the auto- matic overload reset to occur.
	Coolant temperature sender is malfunctioning.	Replace the temperature sender.
	Coolant temperature gauge is malfunctioning.	Replace the temperature gauge.
	Coolant is not free to circulate through the heater.	Ensure that the coolant hoses are clear. Repair or replace hoses as necessary.
	The coolant heater has failed electrically.	Replace the coolant heater.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.8 Coolant Temperature Below Normal (continued)	Electronic fault codes are active.	Refer to the Vendor supplied liter- ature or contact an Authorized Cummins Repair Facility for Fault Codes.
	Coolant thermostat has failed open.	Test operation of the thermostat. Replace the thermostat per instructions in Section 6 - Mainte- nance as necessary.
	Coolant temperature sender is malfunctioning.	Replace the temperature sender.
7.1.9 Raw Water Drain Steam- ing	Raw water flow did not start when the engine started.	Check engine coolant tempera- ture. Go to, Coolant Temperature Above Normal in this section.
<b>NOTE:</b> The raw water drain from the Coolant Heat Exchanger may steam if raw water flow is inade- quate when the engine is running. It may also steam shortly after the engine is stopped. If coolant is leaking into the raw water drain	Engine coolant is leaking into the raw water piping in the coolant heat exchanger.	Remove the coolant heat exchanger and perform the pres- sure test. Refer to Section 6 - Maintenance. If pressure is not maintained, replace the heat exchanger.
piping, the steaming may last for some time while the engine cools. Antifreeze may also be observed in the raw water drain.	Raw water flow not adequate.	Compare actual flow rate against required flow rate - adjust regula- tors to required flow.
7.1.10 Raw Water Solenoid Valve fails to Operate NOTE: The raw water solenoid	Solenoid valve fails to close when the engine stops.	Replace the solenoid valve. Clean the raw water strainer more fre- quently. Increase the frequency of operational testing.
failure may fail to open or to close. The normally closed valve may fail to open when the engine starts. This fault will prevent raw water flow through the normal	Solenoid valve fails to energize.	Check electrical continuity and insulation from ground to the sole- noid. Repair any open or short cir- cuits in the wiring.
valves. Bypass flow should be aligned in this event. The valve may also fail to close because of mechanical blockage. In this	Solenoid fails to open mechani- cally. <b>NOTE:</b> <i>Apply 12 VDC to standard</i>	Apply temporary voltage to the solenoid. If the solenoid fails to operate, replace it. Contact an Authorized Cummins Repair
event, the raw water flow from the heat exchanger does not stop when it should. Depending upon the fire protection system piping, the open solenoid valve may drain all water from the fire protection system piping that is higher than the engine's piping.	operating systems or 24 VDC to optional operating systems.	Facility.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.11 Auto Start failure - Does not Crank on BATT A or B	The electrical connection from the fire protection system to terminal board has failed.	Test continuity and insulation from ground between the fire pro- tection system and the engine control panel. Locate and repair any electrical fault in the field wiring or in the fire protection system panel.
	The electrical connection from ter- minal board to relay has failed.	Test continuity and insulation from ground between the terminal board and the relay. Locate and repair any electrical fault.
	Relay has failed.	Check de-energized continuity at relay. Replace relay if the circuit is open. Contact an Authorized Cummins Repair Facility.
	The Fire Protection System fails to produce either redundant start signal to the fire pump.	Locate and correct the common mode fault in the Fire Protection System.
7.1.12 Auto Start failure - Cranks but does not Start NOTE: The fire pump engine will	The overspeed switch has acti- vated. The overspeed lamp is illu- minated on the local control panel.	Press the RESET switch on the local control panel.
crank automatically when either solenoid A or solenoid B is selected at the fire protection system. However, the engine does not start. The engine will	Control power from the Fire Pro- tection System is not available at local control panel TB-1.	Locate and correct the fault in the Fire Protection System or the field wiring to the local control panel as necessary.
start locally. If local starting problems are identified, go to the applicable Manual Start Failure	Circuit Breaker CB is open in the local control panel.	Check whether Circuit Breaker CB at the local control panel is open.
troubleshooting table.		If open, reset the circuit breaker. Locate and correct any electrical faults in the control panel. Press the RESET Switch on the local control panel.
	The AUTO/MANUAL Mode Switch fails to select AUTO mode.	Open Circuit Breaker CB at the local control panel and test switch operation electrically as neces- sary.
		Replace the switch or repair other electrical faults as necessary. When done, close Circuit Breaker CB at the local control panel.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.12 Auto Start failure - Cranks but does not Start (continued)	The overspeed switch has failed. <b>NOTE:</b> Check system basics - Battery voltage level - Fuel supply - Crank speed Reference base engine T/R manual.	Check power and grounding to the overspeed switch. Repair any electrical faults. Test and adjust the overspeed setting. Refer to Overspeed Set Point Adjustment and Testing in Section 6 - Maintenance. Replace switch as necessary.
7.1.13 Auto Start failure - Engine Starts but Crank Terminate Does Not Occur	The overspeed switch not cor- rectly adjusted or has failed.	With the engine running, verify speed sensor input to the over-speed switch.
		If signal is not present, see Speed Sensor Has Failed. The tachome- ter also indicates zero speed.
		Adjust the overspeed switch crank terminate set point. Replace the overspeed switch as necessary.
	Breaker has tripped. The raw water solenoid valve fails to open.	Open the raw water bypass valves. RESET breaker switch. Locate and repair any local elec- trical fault.
	The speed sensor has failed. The tachometer indicates zero RPM.	Locate and repair any electrical fault in the speed sensor circuitry. Replace the speed sensor as necessary.
	An electrical fault is present in the Fire Protection System.	Test continuity and insulation from ground between the fire pro- tection system and the engine control panel. Locate and repair any electrical fault in the field wiring.
	An electrical fault is present between Control Panel and the Fire Protection System.	Test continuity and insulation from ground between the fire pro- tection system and the engine control panel. Locate and repair any electrical fault in the field wiring.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.14 Manual Start Failure from Solenoid Lever - Does not Crank on A or B	Crank Battery A and B switches failed to make contact.	Test electrical operation of Crank Batt A and B Switches. Replace the faulty switches as necessary.
<b>NOTE:</b> The fire pump engine will	Both batteries dead.	Charge or replace batteries.
not crank locally when either solenoid lever is actuated.	Solenoid A/B failed to operate.	Test the electrical operation of the Solenoid A and Solenoid B. Replace the faulty solenoids as necessary.
	Starter motor has failed.	Replace the starter motor.
	An electrical fault is present in the power or ground circuit for the starter motor.	Test continuity and insulation from ground between the battery splice, the ground connection, and the starter motor. Locate and repair any electrical fault.
	Engine is seized.	Bar the engine over to break the seizure. Contact an Authorized Cummins Repair Facility.
7.1.15 Manual Start Failure from Control Panel - Does not Crank on A or B	The AUTO/MANUAL Mode Switch contact fails to close.	Test the electrical operation of the AUTO/MANUAL Mode Switch. Replace the faulty switch as nec- essary.
<b>NOTE:</b> The fire pump engine will not crank locally from the control panel when either CRANK BATT A or CRANK BATT B is selected, however, it does start when a solenoid lever is actuated.	An electrical fault exists in the signal power circuit or the ground to the Relays.	Test continuity and insulation from ground between the AUTO/ MANUAL Mode Switch and the Relays. Check the relay connec- tion to ground. Locate and repair any electrical fault.
	Breaker Switch has tripped. The raw water solenoid valve also fails to open.	Open the raw water bypass valves. Locate and repair any local electrical fault. RESET the Breaker Switch.
7.1.15 Manual Start Failure from Control Panel - Does not Crank on A or B (contin- ued)	An electrical fault exists in the signal power circuit or the ground to the overspeed switch's crank circuit.	Test continuity and insulation from ground between breaker and the overspeed switch's crank cir- cuit. Check the crank circuit output to the CRANK BATT Switches. Locate and repair any electrical fault.
	Overspeed switch crank circuit fails to reset with engine shut- down.	Test and adjust the crank setting as necessary. Refer to Over- speed Set Point Adjustment and Testing in Section 6 - Mainte- nance. Replace the overspeed switch as necessary.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.16 Engine Cranks Normally But Will Not Start (No Exhaust Smoke)	Electronic fault codes are active.	Refer to the Vendor supplied liter- ature or contact an Authorized Cummins Repair Facility for Fault Codes.
	Electronic control module (ECM) is locked up.	Disconnect the battery cables for 30 seconds. Then, reconnect the battery cables, and start the engine.
	Battery voltage supply to the elec- tronic control module (ECM) is low, interrupted, or open.	Check the battery connections, the fuses, and the battery supply circuit.
	No fuel in supply tank.	Check and replenish fuel supply. Check fittings and hose connec- tions and hose conditions.
	Air is in the fuel system.	Check for air in the fuel system. Tighten or replace the fuel con- nections, fuel lines, fuel tank stand pipe and fuel filters as nec- essary. Vent air from the system.
	Fuel drain line is restricted.	Check the fuel drain lines for restriction. Clear or replace the fuel lines, check valves, or tank vents as necessary.
	Fuel filter is clogged.	Replace the fuel pre-filter/water separator. Refer to Change Fuel Filter in Section 6 - Maintenance.
		Replace the primary fuel filter. Refer to Change Fuel Filter in Section 6 - Maintenance.
	Fuel grade is not correct for the application or the fuel quality is poor.	Operate the engine from a tank of high-quality no. 2 diesel fuel.
	Fuel injection pump is malfunc- tioning. Pump timing incorrect.	Contact an Authorized Cummins Repair Facility.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.16 Engine Cranks Normally	Fuel tank is empty.	Fill the fuel supply tank.
But Will Not Start (No Exhaust Smoke) (contin- ued)	Fuel pump overflow valve is mal- functioning.	Check the overflow valve. Replace if necessary.
	Fuel suction line is restricted.	Check the fuel suction line for restriction.
	Fuel connections on the suction side of the fuel lift pump are loose.	Tighten all the fuel fittings and connections between the fuel tanks and fuel lift pump.
	Fuel suction stand pipe in the fuel tank is broken.	Check and repair the stand pipe, if necessary.
	Fuel supply is not adequate.	Locate and correct the restriction in the customer supplied fuel lines to the engine.
	Fuel tank air breather is blocked.	Clean the fuel tank breather.
	Fuel lift pump is malfunctioning.	Check the fuel lift pump for correct operation. Check the pump output pressure. Replace the fuel lift pump if necessary.
	Injection pump drive shaft or drive shaft key is damaged.	Repair or replace the injection pump.
	Fuel injectors are plugged.	Replace the fuel injectors.
	Moisture is in the wiring harness connectors.	Dry the connectors with Cummins electronic cleaner, Part Number 3824510.
	Starter motor rotation is not correct or not turning engine.	Check the direction of crankshaft rotation. Replace the starter motor as necessary. Contact an Authorized Cummins Repair Facility.
7.1.17 Engine Cranks Slowly But Does Not Start	The battery cable connections are loose, broken, or corroded creat- ing excessive resistance.	Check the battery cables and con- nections. Ensure that connections are clean and tight.
<b>NOTE:</b> <i>Typical engine cranking</i> <i>speed is 120 RPM. Engine</i> <i>cranking speed can be checked</i> <i>with a hand-held tachometer,</i>	The battery is not properly charged or has failed.	Recharge the battery. If the battery doers not take the charge, replace it.
stroboscope, or electronic service tool	Engine oil level is too high.	Check the oil level per instructions in Section 6 - Maintenance. Drain any excess oil.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.17 Engine Cranks Slowly But Does Not Star (contin- ued)	Engine oil is the wrong grade or type.	Check the grade and type of oil. Refer to Engine Oil Recommen- dations and Specifications in Section 6 - Maintenance.
		If the wrong type or grade of oil is present, drain and replace it. Refer to Change Engine Oil and Filters in Section 6 - Maintenance.
	Engine temperature is too low.	Troubleshoot per Coolant Tem- perature Below Normal (Engine Off) in this section.
	Starter motor is malfunctioning.	Replace the starter motor. Contact an Authorized Cummins Repair Facility.
7.1.18 Engine Stops During Operation	Normal automatic mode shut- down occurs when the fire protec- tion systems removes the signal power feed to the local control panel.	No action required. This is a desirable outcome.
	The selected engine control module (ECM) has detected a serious fault condition. The ECM's STOP light is displayed.	For instructions on how to read active fault codes, refer to Diag- nostic Fault Codes in the Vendor supplied literature or contact a Cummins Authorized Repair Facility.
	In the automatic mode, the signal power feed is lost from the fire protection system to the control panel.	Locate and correct the electrical fault in the fire protection system or the field wiring to the engine control panel.
	Circuit breaker on control panel tripped.	Locate and correct the electrical fault in engine control panel. RESET the tripped breaker.
	An overspeed trip has occurred. The overspeed trip lamp illumi- nated on the local control panel.	Remote indications may also be present. Overspeed switch failure has occurred. The trip indications may not be present. Go to Engine Overspeed Trip in this section.
	Power supply or grounding fault exists at the Electronic Control Module.	Locate and correct the electrical fault in the power supply or grounding for the ECM.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.18 Engine Stops During Operation (continued)	The selected ECM has failed.	Select the alternate ECM. Replace the failed ECM. Contact an Authorized Cummins Repair Facility.
	Fuel tank level is low.	Fill the fuel tank. Fill and bleed the fuel lines to the engine.
	Clogged fuel tank air breather hole.	Clean the fuel tank breather.
	Fuel piping to engine is clogged.	Clean and repair engine fuel piping.
	The fuel filter is clogged.	Replace the fuel filter. Refer to Change Fuel Filter in Section 6 - Maintenance.
	Air is trapped in the low pressure fuel lines at the engine.	Bleed the fuel lines. Refer to Air in Fuel in Section 6 - Maintenance.
	Fuel lift pump has failed	Check the fuel lift pump for correct operation. Check the pump output pressure. Replace the fuel lift pump if necessary. Contact an Authorized Cummins Repair Facility.
	Fuel injection pump has failed.	Replace the fuel injection pump. Contact an Authorized Cummins Repair Facility.
	Electronic fault codes are active.	Refer to the Vendor supplied liter- ature or contact an Authorized Cummins Repair Facility.
	Programmable parameters or selected features are not correct.	Check the programmable param- eters and the selected features with an electronic service tool. Set the parameters and features again if necessary. Refer to a Cummins Authorized Repair Facility.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.19 Engine Will Not Reach Rated Speed (RPM)	Tachometer is not calibrated. Compare the tachometer reading with a hand held tachometer or an electronic service tool reading.	If out of calibration, calibrate the tachometer as necessary at the CAL adjustment on the back of the gauge. Refer to the Vendor supplied literature for additional information. Tachometer is mal- functioning. Replace the tachom- eter. Contact an Authorized Cummins Repair Facility.
	Engine power output is low.	Refer to the Engine Acceleration or Response Poor in this section.
	Fuel filter requires replacement.	Refer to Change Fuel Filter per the instructions in Section 6 - Maintenance.
	Fuel grade not correct for the application, or fuel quality is poor.	Operate the engine with a good quality no. 2 diesel fuel.
	Fuel suction line is restricted.	Check the fuel suction line for restriction.
	Air-fuel tube leaking, waste gate diaphragm ruptured, or waste gate plumbing damaged.	Tighten the fittings, repair plumb- ing, replace waste gate dia- phragm.
	Charge air cooler restricted.	Inspect the air cooler for internal and external restrictions. Replace the restricted cooler if necessary.
	Fuel supply is not adequate.	Locate and correct the restriction in the fuel lines to the engine.
	Stop circuit malfunction in the fire pump controller of field wiring.	In the AUTO mode, the fire pump engine stops upon loss of signal power from the fire pump control- ler. Check stop circuit in Fire Pump Controller.
7.1.20 Engine Will Not Shut Off Remotely	Stop circuit malfunction in the fire pump controller of field wiring.	Correct any faults. Check for short to voltage on the signal wiring from the fire pump controller to the engine control panel. Correct any faults. Check operation of the switch contacts of the AUTO/ MANUAL switch at the engine control panel. Replace the switch if the switch contacts fail to operate properly.
	Electronic fault codes are active.	Refer to the Vendor supplied liter- ature or contact a Cummins Authorized Repair Facility.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.20 Engine Will Not Shut Off Remotely (continued)	Engine running on fumes drawn into the air intake.	Identify and isolate the source of the combustible fumes. Contact an Authorized Cummins Repair Facility.
7.1.21 Engine Will Not Shut Off Locally	Inadvertent power source is present from the fire pump con- troller.	In the MANUAL Mode, the fire pump engine stops when the AUTO/MANUAL Switch is returned to the AUTO Mode.
		Check for inadvertent voltage on the wiring to terminal board at the engine control panel.
	Electronic fault codes are active.	Refer to the Vendor supplied liter- ature or contact a Cummins Authorized Repair Facility.
	Engine running on fumes drawn into the air intake.	Identify and isolate the source of the combustible fumes.
7.1.22 Fuel Consumption is Excessive	Fuel is leaking.	Check the fuel lines, fuel connec- tions, and fuel filters for leaks. Check the fuel lines to the supply tanks. Repair any leaks.
	Poor-quality fuel is being used.	Assure good-quality no. 2 diesel fuel is being used.
	Defective or clogged injection nozzle.	Replace the defective or clogged injection nozzle.
	Injection pump is adjusted incor- rectly causing excessive injection.	Adjust or replace the injection pump.
	Air intake or exhaust leaks.	Check for loose or damaged piping connections and missing pipe plugs. Check the turbo- charger and exhaust manifold mounting. Repair any leaks.
	Air intake system restriction is above specification.	Check the air intake system for restriction. Refer to Check Air Cleaner Service Indicator in Section 6 - Maintenance. Replace the air filter as necessary.
7.1.23 Fuel or Engine Oil Leaking From Exhaust Manifold	Intake air restriction is high.	Check the air intake system for restriction. Refer to Check Air Cleaner Service Indicator in Section 6 - Maintenance. Replace the air filter if required.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.23 Fuel or Engine Oil Leaking From Exhaust Manifold (continued)	Turbocharger drain line is restricted.	Remove the turbocharger drain line and check for restriction. If required, clean or replace the drain line.
	Turbocharger oil seal is leaking.	Check the turbocharger for oil seals and for leaks. Refer to the Turbocharger Leaks Engine Oil or Fuel symptom tree in this section.
7.1.24 Engine Oil is Contami- nated	Bulk oil supply is contaminated.	Check the oil supply. Replace it is necessary. Drain the oil and replace with non-contaminated oil. Also, replace the oil filter. Refer to Change Engine Oil and Filters in Section 6 - Maintenance.
	Fuel is present in the engine oil.	Refer to the Fuel in Engine Oil in this section.
	Coolant is present in the engine oil.	Refer to the Coolant in Engine Oil symptom tree in this section.
	Metal is present in the engine oil.	Contact an Authorized Cummins Repair Facility.
7.1.25 Engine Oil Consumption is Excessive	Verify the oil consumption rate.	Check the amount of oil added versus the operating hours.
	Engine crankcase overfilled.	Remove excess oil and recali- brate dipstick.
	External engine leak is present.	Inspect the engine and its compo- nents for seal, gasket, tappet cover, oil cooler, or drain cocks leaks. Repair or correct any leaks.
	Crankcase ventilation system is plugged.	Check and clean the crank case breather and vent tube per the instructions in Section 6 - Mainte- nance.
	Turbocharger oil seal is leaking.	Check the turbocharger compres- sor and turbine seals. Contact an Authorized Cummins Repair Facility.
	Engine oil cooler is leaking.	Check for engine oil in the cool- ant. Refer to the Engine Oil in the Coolant in this section. Contact an Authorized Cummins Repair Facility.
	Engine oil does not meet specifi- cations for operating conditions.	Change the oil and filters per the instructions in Section 6 - Maintenance.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.25 Engine Oil Consumption is Excessive (continued)	Engine oil drain interval is exces- sive.	Verify the correct engine oil drain interval. Refer to Change Engine Oil and Filters in Section 6 - Main- tenance.
	Piston, cylinder liner, or piston rings are worn or damaged.	Check for air intake system leaks. Contact an Authorized Cummins Repair Facility.
	Piston rings are not seated cor- rectly (after an engine rebuild or piston installation).	Check blowby. If blowby is exces- sive, check the piston rings for correct seating. Contact an Authorized Cummins Repair Facility.
7.1.26 Engine Oil in the Coolant	Bulk coolant supply is contami- nated.	Check the coolant expansion tank per the instructions in Section 6 - Maintenance. Drain the coolant and replace with non-contami- nated coolant. Refer to Drain and Flush Cooling System in Section 6. Replace the coolant filter. Refer to Change Coolant Filter in Section 6 - Maintenance.
	Engine oil cooler is malfunction- ing.	Check the oil cooler. Contact an Authorized Cummins Repair Facility.
	Cylinder head gasket damaged or leaking.	Contact an Authorized Cummins Repair Facility.
	Cylinder head is cracked or porous.	Remove intake manifold. Remove exhaust manifold. Check for evi- dence of coolant leak. If neces- sary, operate engine at idle. Pressure-test the cylinder head. Contact an Authorized Cummins Repair Facility.
	Cylinder block is cracked or porous.	Remove the oil pan. Pressure-test the cooling system to check for leaks. Contact an Authorized Cummins Repair Facility.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.27 Engine Overspeed Trip NOTE: An engine overspeed trip occurs when the engine's speed exceeds the value specified on	Engine operated at too great a speed due to catastrophic load failure such as pipe break, pump mechanical failure, or loss of suc- tion.	Correct the cause of the load fail- ure. Contact a Cummins Autho- rized Repair Facility.
the Factory Setting Tag described in Section 2 - Description. The trip isolates the fuel supply to the engine and it stops immediately. The trip is indicated on the local control panel and inside the local	Engine actually operated at too great a speed due to configuration error.	Check rated speed setting as specified on the Factory Setting Tag. Refer to Rated Speed Set Point Adjustment and Testing in Section 6 - Maintenance.
control panel on the speed switch. Additionally, a trip output is supplied to the fire protection system for remote display.	Overspeed switch is set at too low a set point.	Check overspeed speed setting as specified on the Factory Setting Tag. Refer to Overspeed Set Point Adjustment and Testing in Section 6 - Maintenance.
	Speed switch wiring failure has occurred.	Check continuity and insulation from ground for the signal power wiring and ground wiring to the speed switch. Replace defective components and repair electrical faults.
	Speed switch failure has occurred.	If the speed switch fails to operate as per Overspeed Set Point Adjustment and Testing in Section 6 - Maintenance, replace the speed switch. Contact an Authorized Cummins Repair Facility.
7.1.28 Tachometer Does not Indicate Engine Speed	An electrical fault exists in the tachometer power and grounding circuits.	Check continuity and insulation from ground for the power wiring and ground wiring to the tachome- ter. Contact an Authorized Cummins Repair Facility. Replace defective components and repair electrical faults.
	An electrical fault exists in the speed sensor input circuit.	This fault may also cause a failure in the crank terminate signal to the fire protection system. Check continuity and insulation from ground for the speed sensor cir- cuit. Contact an Authorized Cummins Repair Facility. Replace defective components and repair electrical faults.

PROBLEM	POSSIBLE CAUSE	SOLUTION
7.1.28 Tachometer Does not Indicate Engine Speed (continued)	The speed sensor has failed.	With the engine running, check the signal from the speed sensor with an oscilloscope or pulse counter. Replace the speed sensor is it has failed. Contact an Authorized Cummins Repair Facility.
	The tachometer has failed.	Check the operation of the tachometer with a pulse genera- tor. Replace the tachometer is it has failed. Contact an Authorized Cummins Repair Facility.

# **Section 8 - Component Parts and Assemblies**

#### 8.1 Part Ordering Information

Replacement parts for the Cummins Inc. equipment are manufactured to the same quality standards and specifications as the original equipment. Unapproved substitution may result in poor performance, reduced service life, lost production or unsafe operation.

Cummins Inc. relies on the best and most cost effective shipping methods, unless specific instructions or requirements are requested by the customer. When ordering parts please be prepared to provide the following information.

#### PART REQUESTS REQUIRE:

- 1. Model and serial number.
- 2. Part description by name or number
- 3. Quantity required.
- 4. Purchase order number.

**NOTE:** A purchase order number is desirable, even if the part(s) are supplied on a Returned Goods Authorization (RGA) issue number. A purchase order number helps Cummins NPower Inc. and its customer track the parts and necessary credits.

#### 8.2 Routine Service and Parts

Personnel at Cummins Authorized Repair Locations can assist you with the correct operation and service of your engine. Cummins has a worldwide service network of more than 5,000 Distributors and Dealers who have been trained to provide sound advice, expert service, and complete parts support. Check the telephone directory yellow pages or refer to the directory in this section for the nearest Cummins Authorized Repair Location.

# 8.3 Emergency Repairs and Technical Service

The Cummins Customer Assistance Center provides a 24-hour, toll free telephone number to aid in technical and emergency service when a Cummins Authorized Repair Location can not be reached or is unable to resolve an issue with a Cummins product.

If assistance is required, call Toll-Free: 1-800-DIESELS (1-800-343-7357) Includes all 50 states, Bermuda, Puerto Rico, Virgin Islands, and the Bahamas.

Outside of North America contact your Regional Office. Telephone numbers and addresses are listed in the International Directory.

Refer also to the Cummins Inc. web site at www.cummins.com

#### 8.4 Recommended Spares Inventory

To minimize downtime and increase productivity, Cummins Inc. recommends maintaining a stock of spare parts critical to uninterrupted engine operation. Shipping costs can be lower using ground transportation rather than overnight or next day air freight. For this reason Cummins Inc. can provide a list of recommended spare parts. Contact the Cummins Authorized Repair Location for additional information.
